

ESP32-C2

ESP-AT User Guide

Release v2.3.0.0-esp32c3-361-gb5430077
Espressif Systems
Nov 25, 2022

Table of contents

Table of contents	i
1 Get Started	3
1.1 What is ESP-AT	3
1.2 Hardware Connection	4
1.2.1 What You Need	4
1.2.2 ESP32C2-4MB Series	5
1.2.3 ESP32C2-2MB Series	6
1.3 Downloading Guide	6
1.3.1 Download AT Firmware	6
1.3.2 Flash AT Firmware into Your Device	8
1.3.3 Check Whether AT Works	11
2 AT Binary Lists	13
2.1 Released Firmware	13
2.1.1 ESP32-C2 2MB Series	13
2.1.2 ESP32-C2 4MB Series	13
2.2 Brief Introduction to AT Firmware	14
2.3 Which Type of Firmware Shall I Choose?	14
2.3.1 Officially Released Firmware (Recommended)	14
2.3.2 GitHub Temporary Firmware	15
2.3.3 Firmware with Updated Parameters	15
2.3.4 Self-Compiled Firmware	15
2.4 After Getting Firmware, What Next?	15
3 AT Command Set	17
3.1 Basic AT Commands	17
3.1.1 AT: Test AT Startup	17
3.1.2 AT+RST: Restart a Module	18
3.1.3 AT+GMR: Check Version Information	18
3.1.4 AT+CMD: List all AT commands and types supported in current firmware	19
3.1.5 AT+GSLP: Enter Deep-sleep Mode	19
3.1.6 ATE: Configure AT Commands Echoing	20
3.1.7 AT+RESTORE: Restore Factory Default Settings	20
3.1.8 AT+UART_CUR: Current UART Configuration, Not Saved in Flash	20
3.1.9 AT+UART_DEF: Default UART Configuration, Saved in Flash	21
3.1.10 AT+SLEEP: Set the Sleep Mode	23
3.1.11 AT+SYSRAM: Query Current Remaining Heap Size and Minimum Heap Size	24
3.1.12 AT+SYSMSG: Query/Set System Prompt Information	24
3.1.13 AT+SYSFLASH: Query/Set User Partitions in Flash	26
3.1.14 AT+FS: Filesystem Operations	27
3.1.15 AT+FSMOUNT: Mount/Unmount Filesystem	28
3.1.16 AT+RFPOWER: Query/Set RF TX Power	29
3.1.17 Note	29
3.1.18 AT+SYSROLLBACK: Roll Back to the Previous Firmware	29
3.1.19 AT+SYSTIMESTAMP: Query/Set Local Time Stamp	30
3.1.20 AT+SYSLOG: Enable or Disable the AT Error Code Prompt	30

3.1.21	AT+SLEEPWKCFG: Set the Light-sleep Wakeup Source and Awake GPIO	32
3.1.22	AT+SYSSTORE: Query/Set Parameter Store Mode	33
3.1.23	AT+SYSREG: Read/Write the Register	34
3.2	Wi-Fi AT Commands	34
3.2.1	AT+CWMODE: Query/Set the Wi-Fi Mode (Station/SoftAP/Station+SoftAP)	35
3.2.2	AT+CWSTATE: Query the Wi-Fi state and Wi-Fi information	36
3.2.3	AT+CWLAP: Connect to an AP	37
3.2.4	AT+CWRECONNCFG: Query/Set the Wi-Fi Reconnecting Configuration	39
3.2.5	AT+CWLAPOPT: Set the Configuration for the Command AT+CWLAP	40
3.2.6	AT+CWLAP: List Available APs	41
3.2.7	AT+CWLQAP: Disconnect from an AP	43
3.2.8	AT+CWSAP: Query/Set the configuration of an ESP32-C2 SoftAP	43
3.2.9	AT+CWLIF: Obtain IP Address of the Station That Connects to an ESP32-C2 SoftAP	44
3.2.10	AT+CWLQIF: Disconnect Stations from an ESP32-C2 SoftAP	44
3.2.11	AT+CWDHCP: Enable/Disable DHCP	45
3.2.12	AT+CWDHCPS: Query/Set the IPv4 Addresses Allocated by an ESP32-C2 SoftAP DHCP Server	46
3.2.13	AT+CWAUTOCONN: Automatically Connect to an AP When Powered on	47
3.2.14	AT+CWAPPROTO: Query/Set the 802.11 b/g/n Protocol Standard of SoftAP Mode	48
3.2.15	AT+CWSTAPROTO: Query/Set the 802.11 b/g/n Protocol Standard of Station Mode	48
3.2.16	AT+CIPSTAMAC: Query/Set the MAC Address of an ESP32-C2 Station	49
3.2.17	AT+CIPAPMAC: Query/Set the MAC Address of an ESP32-C2 SoftAP	50
3.2.18	AT+CIPSTA: Query/Set the IP Address of an ESP32-C2 Station	51
3.2.19	AT+CIPAP: Query/Set the IP Address of an ESP32-C2 SoftAP	52
3.2.20	AT+CWSTARTSMART: Start SmartConfig	53
3.2.21	AT+CWSTOPSMART: Stop SmartConfig	54
3.2.22	AT+WPS: Enable the WPS Function	54
3.2.23	AT+MDNS: Configure the mDNS Function	55
3.2.24	AT+CWJEAP: Connect to a WPA2 Enterprise AP	56
3.2.25	AT+CWHOOSTNAME: Query/Set the Host Name of an ESP32-C2 Station	58
3.2.26	AT+CWCOUNTRY: Query/Set the Wi-Fi Country Code	59
3.3	TCP/IP AT Commands	60
3.3.1	AT+CIPV6: Enable/disable the network of Internet Protocol Version 6 (IPv6)	60
3.3.2	AT+CIPSTATE: Obtain the TCP/UDP/SSL Connection Information	61
3.3.3	AT+CIPSTATUS (deprecated): Obtain the TCP/UDP/SSL Connection Status and Information	62
3.3.4	AT+CIPDOMAIN: Resolve a Domain Name	62
3.3.5	AT+CIPSTART: Establish TCP Connection, UDP Transmission, or SSL Connection	63
3.3.6	AT+CIPSTARTEX: Establish TCP connection, UDP transmission, or SSL connection with an Automatically Assigned ID	67
3.3.7	[Data Mode Only] +++: Exit from Data Mode	67
3.3.8	AT+CIPSEND: Send Data in the Normal Transmission Mode or Wi-Fi Passthrough Mode	67
3.3.9	AT+CIPSENDL: Send Long Data in Parallel in the Normal Transmission Mode.	69
3.3.10	AT+CIPSENDCFG: Set the Configuration for the Command AT+CIPSENDL	70
3.3.11	AT+CIPSENDEX: Send Data in the Normal Transmission Mode in Expanded Ways	71
3.3.12	AT+CIPCLOSE: Close TCP/UDP/SSL Connection	72
3.3.13	AT+CIFSR: Obtain the Local IP Address and MAC Address	72
3.3.14	AT+CIPMUX: Enable/disable Multiple Connections	73
3.3.15	AT+CIPSERVER: Delete/create a TCP/SSL Server	74
3.3.16	AT+CIPSERVERMAXCONN: Query/Set the Maximum Connections Allowed by a Server	75
3.3.17	AT+CIPMODE: Query/Set the Transmission Mode	76
3.3.18	AT+SAVETRANSLINK: Set Whether to Enter Wi-Fi Passthrough Mode on Power-up	77
3.3.19	AT+CIPSTO: Query/Set the local TCP/SSL Server Timeout	78
3.3.20	AT+CIPSNTPCFG: Query/Set the Time Zone and the SNTP Server	79
3.3.21	AT+CIPSNTPTIME: Query the SNTP Time	80
3.3.22	AT+CIPSNTPTINTV: Query/Set the SNTP time synchronization interval	81
3.3.23	AT+CIPFWVER: Query the Existing AT Firmware Version on the Server	82
3.3.24	AT+CIUPDATE: Upgrade Firmware Through Wi-Fi	82

3.3.25	AT+CIPDINFO: Set “+IPD” Message Mode	85
3.3.26	AT+CIPSSLCONF: Query/Set SSL Clients	85
3.3.27	AT+CIPSSLCCN: Query/Set the Common Name of the SSL Client	86
3.3.28	AT+CIPSSLCSNI: Query/Set SSL Client Server Name Indication (SNI)	87
3.3.29	AT+CIPSSLCALPN: Query/Set SSL Client Application Layer Protocol Negotiation (ALPN)	88
3.3.30	AT+CIPSSLCPSK: Query/Set SSL Client Pre-shared Key (PSK)	89
3.3.31	AT+CIPRECONNINTV: Query/Set the TCP/UDP/SSL reconnection Interval for the Wi-Fi Passthrough Mode	90
3.3.32	AT+CIPRECVMODE: Query/Set Socket Receiving Mode	91
3.3.33	AT+CIPRECVDATA: Obtain Socket Data in Passive Receiving Mode	92
3.3.34	AT+CIPRECVLEN: Obtain Socket Data Length in Passive Receiving Mode	92
3.3.35	AT+PING: Ping the Remote Host	93
3.3.36	AT+CIPDNS: Query/Set DNS Server Information	94
3.3.37	AT+CIPTCPOPT: Query/Set the Socket Options	95
3.4	Bluetooth® Low Energy AT Commands	97
3.4.1	AT+BLUFI: Start or Stop BluFi	97
3.4.2	AT+BLUFINAME: Query/Set BluFi Device Name	98
3.4.3	AT+BLUFISEND: Send User-Customized Data over BluFi	99
3.5	MQTT AT Commands	100
3.5.1	AT+MQTTUSERCFG: Set MQTT User Configuration	100
3.5.2	AT+MQTTLONGCLIENTID: Set MQTT Client ID	101
3.5.3	AT+MQTTLONGUSERNAME: Set MQTT Username	101
3.5.4	AT+MQTTLONGPASSWORD: Set MQTT Password	102
3.5.5	AT+MQTTCONNCFG: Set Configuration of MQTT Connection	103
3.5.6	AT+MQTTALPN: Set MQTT Application Layer Protocol Negotiation (ALPN)	103
3.5.7	AT+MQTTCONN: Connect to MQTT Brokers	104
3.5.8	AT+MQTTPUB: Publish MQTT Messages in String	105
3.5.9	AT+MQTTPUBRAW: Publish Long MQTT Messages	106
3.5.10	AT+MQTTSUB: Subscribe to MQTT Topics	106
3.5.11	AT+MQTTUNSUB: Unsubscribe from MQTT Topics	107
3.5.12	AT+MQTTCLEAN: Close MQTT Connections	108
3.5.13	MQTT AT Error Codes	108
3.5.14	MQTT AT Notes	110
3.6	HTTP AT Commands	110
3.6.1	AT+HTTPCLIENT: Send HTTP Client Request	110
3.6.2	AT+HTTPGETSIZE: Get HTTP Resource Size	111
3.6.3	AT+HTTPCGET: Get HTTP Resource	112
3.6.4	AT+HTTPCPOST: Post HTTP data of specified length	113
3.6.5	AT+HTTPCPUT: Put HTTP data of specified length	113
3.6.6	AT+HTTPURLCFG: Set/Get long HTTP URL	114
3.6.7	HTTP AT Error Codes	115
3.7	Signaling Test AT Commands	115
3.7.1	AT+FACTPLCP: Send with Long or Short PLCP	115
3.8	Web Server AT Commands	116
3.8.1	AT+WEBSERVER: Enable/disable Wi-Fi connection configuration via Web server	116
3.9	Driver AT Commands	117
3.9.1	AT+DRVADC: Read ADC Channel Value	117
3.9.2	AT+DRVPWMINIT: Initialize PWM Driver	118
3.9.3	AT+DRVPWMDUTY: Set PWM Duty	119
3.9.4	AT+DRVPWMFADE: Set PWM Fade	119
3.9.5	AT+DRVI2CINIT: Initialize I2C Master Driver	120
3.9.6	AT+DRVI2CRD: Read I2C Data	120
3.9.7	AT+DRVI2CWRDATA: Write I2C Data	121
3.9.8	AT+DRVI2CWRBYTES: Write No More Than 4 Bytes I2C Data	122
3.9.9	AT+DRVSPICONFGPIO: Configure SPI GPIO	123
3.9.10	AT+DRVSPINIT: Initialize SPI Master Driver	123
3.9.11	AT+DRVSPIRD: Read SPI Data	124
3.9.12	AT+DRVSPIWR: Write SPI Data	124

3.10	User AT Commands	125
3.10.1	AT+USERRAM: Operate user's free RAM	126
3.10.2	AT+USEROTA: Upgrade the Firmware According to the Specified URL	127
3.10.3	AT+USERWKMCFG: Configure How AT Wakes Up MCU	128
3.10.4	AT+USERMCUSLEEP: MCU Indicates Its Sleep State	129
3.10.5	AT+USERDOCS: Query the ESP-AT User Guide for Current Firmware	130
3.11	AT Command Types	131
3.12	AT Commands with Configuration Saved in the Flash	132
3.13	AT Messages	132
4	AT Command Examples	135
4.1	TCP/IP AT Examples	135
4.1.1	ESP32-C2 as a TCP client in single connection	135
4.1.2	ESP32-C2 as a TCP server in multiple connections	137
4.1.3	UDP transmission with fixed remote IP address and port	138
4.1.4	UDP transmission with changeable remote IP address and port	140
4.1.5	ESP32-C2 as an SSL client in single connection	142
4.1.6	ESP32-C2 as an SSL server in multiple connections	144
4.1.7	ESP32-C2 as an SSL client to create a single connection with mutual authentication	146
4.1.8	ESP32-C2 as an SSL server to create multiple connections with mutual authentication	148
4.1.9	UART Wi-Fi passthrough transmission when the ESP32-C2 works as a TCP client in single connection	150
4.1.10	UART Wi-Fi passthrough transmission when the ESP32-C2 works as a TCP server	152
4.1.11	UART Wi-Fi passthrough transmission when the ESP32-C2 works as a softAP in UDP transparent transmission	154
4.2	MQTT AT Examples	155
4.2.1	MQTT over TCP (with a local MQTT broker)(suitable for a small amount of data)	156
4.2.2	MQTT over TCP (with a local MQTT broker)(suitable for large amounts of data)	157
4.2.3	MQTT over TLS (with a local MQTT broker)	159
4.2.4	MQTT over WSS	160
4.3	MQTT AT Examples for Cloud	162
4.3.1	Obtain certificates and endpoints from AWS IoT	162
4.3.2	Connect to AWS IoT based on mutual authentication with MQTT AT commands	163
4.4	Web Server AT Example	167
4.4.1	Wi-Fi Provisioning Using a Browser	167
4.4.2	OTA Firmware Upgrade Using a Browser	173
4.4.3	Wi-Fi Provisioning Using a WeChat Applet	179
4.4.4	OTA Firmware Upgrade Using a WeChat Applet	189
4.4.5	ESP32-C2 Using Captive Portal	189
4.5	HTTP AT Examples	190
4.5.1	The HEAD method of HTTP client	190
4.5.2	The GET method of HTTP client	191
4.5.3	The POST method of HTTP client (suitable for POST small amount of data)	192
4.5.4	The POST method of HTTP client (recommended method)	193
4.5.5	The PUT method of HTTP client (suitable for no data put)	195
4.5.6	The PUT method of HTTP client (recommended method)	196
4.5.7	The DELETE method of HTTP client	198
4.6	Sleep AT Examples	199
4.6.1	Introduction	199
4.6.2	Set Modem-sleep mode in Wi-Fi mode	200
4.6.3	Set Light-sleep mode in Wi-Fi mode	201
4.6.4	Set Deep-sleep mode	202
5	How to Compile and Develop Your Own AT Project	203
5.1	Compile ESP-AT Project	203
5.1.1	Detailed Steps	203
5.1.2	Step 1. Get Started with ESP-IDF	203
5.1.3	Step 2. Get ESP-AT	204

5.1.4	Step 3. Install Environment	204
5.1.5	Step 4. Connect Your Device	204
5.1.6	Step 5. Configure	205
5.1.7	Step 6. Build the Project	205
5.1.8	Step 7. Flash onto the Device	205
5.1.9	build.py Advanced Usage	206
5.2	How to Set AT Port Pins	206
5.2.1	ESP32-C2 Series	206
5.3	How to add user-defined AT commands	207
5.3.1	Define AT Commands	207
5.3.2	Register AT Commands	209
5.3.3	Give it a try	209
5.3.4	Define Return Values	210
5.3.5	Access Command Parameters	211
5.3.6	Omit Command Parameters	211
5.3.7	Block Command Execution	214
5.3.8	Access Input Data from AT Command Port	214
5.4	How to Improve ESP-AT Throughput Performance	218
5.4.1	[Simple] Quick Configuration	218
5.4.2	[Recommended] Understand Data Stream and Make the Precise Configuration	219
5.5	How to Generate Factory Parameter Bin	221
5.5.1	factory_param_type.csv	221
5.5.2	factory_param_data.csv	222
5.5.3	Add a Customized Module	222
5.5.4	Add a Customized Parameter	224
5.5.5	Modify Factory Parameter Data on an Existing Module	226
5.6	How to Customize Partitions	227
5.6.1	Modify at_customize.csv	227
5.6.2	Generate at_customize.bin	228
5.6.3	Flash at_customize.bin into ESP32-C2 Device	228
5.6.4	Example	228
5.7	How to Add Support for a Module	229
5.7.1	Add Module to factory_param_data.csv	231
5.7.2	Modify esp_at_module_info Structure	231
5.7.3	Configure the Module	231
5.8	SPI AT Guide	232
5.8.1	Overview	232
5.8.2	How to Use SPI AT?	233
5.8.3	SPI AT Throughput	235
5.9	How to Implement OTA Upgrade	236
5.9.1	Comparison Among OTA Commands and Their Application Scenarios	236
5.9.2	Perform OTA Upgrade with ESP-AT OTA Commands	237
5.10	How to Update the ESP-IDF Version	243
5.11	ESP-AT Firmware Differences	244
5.11.1	ESP32-C2 Series	244
5.12	How to Download the Latest Temporary Version of AT Firmware from GitHub	245
5.13	How to Generate PKI Files	246
5.13.1	Certificate Bin Files Format	251
5.13.2	Generate Certificate Bin Files	252
5.13.3	Download or Update Certificate Bin Files	252
5.14	AT API Reference	254
5.14.1	Header File	254
5.14.2	Functions	254
5.14.3	Structures	258
5.14.4	Macros	260
5.14.5	Type Definitions	261
5.14.6	Enumerations	261
5.14.7	Header File	263

5.14.8	Functions	264
5.14.9	Macros	264
6	AT FAQ	265
6.1	AT Firmware	266
6.1.1	There is no released firmware for my module. Where can I get the firmware for it?	266
6.1.2	How to get the source code of AT firmware?	266
6.1.3	How to download the AT firmware on Espressif's official website?	266
6.1.4	How to combine all the bin files compiled by ESP-AT?	266
6.1.5	Does the AT firmware shipped in modules support flow control?	266
6.2	AT Commands and Responses	266
6.2.1	What is the reason why AT prompts busy?	266
6.2.2	Why does the ESP-AT firmware always return the following message after the I powered up the device and sent the first command?	267
6.2.3	What commands are supported by the default ESP-AT firmware on different modules, and from which version are they supported?	267
6.2.4	When the host MCU sends an AT command to the ESP32-C2 device, there is no response. What is the reason?	267
6.2.5	Do AT commands support ESP-WIFI-MESH?	267
6.2.6	Does AT support websocket commands?	267
6.2.7	Can AT command set Bluetooth LE transmit power?	267
6.2.8	How to support commands that are not supported by the default firmware but can be supported after configuring and compiling the ESP-AT project?	267
6.2.9	How to handle special characters in AT commands?	268
6.2.10	Can the serial port baudrate be modified in AT Commands? (Default: 115200)	268
6.2.11	After ESP32-C2 enters the passthrough mode using AT commands, can ESP32-C2 give a message if the connected hotspot is disconnected?	268
6.3	Hardware	268
6.3.1	How big is the chip flash required for ESP-AT firmware on different modules?	268
6.3.2	How to view the error log of AT firmware?	268
6.3.3	The UART1 communication pin used by ESP-AT on the ESP32-C2 module is inconsistent with the default UART1 pin described in the ESP32-C2 module's datasheet?	268
6.4	Performance	268
6.4.1	How long does it take for the AT to connect to Wi-Fi?	268
6.4.2	Is it possible to change the TCP send window size in AT firmware?	269
6.4.3	How to test and optimize the throughput of ESP32-C2 AT?	269
6.5	Other	269
6.5.1	What interfaces of ESP32-C2 chips can be used to transmit AT commands?	269
6.5.2	How does ESP-AT conduct BQB certification?	269
6.5.3	How do I specify the TLS protocol version for ESP32-C2 AT?	269
6.5.4	How to modify the number of TCP connections in AT?	269

	Index	277

This is the documentation for [ESP-AT](#) Development Framework. ESP-AT project was started and powered by [Espressif Systems](#) as an official project, for the [ESP32](#), [ESP32-C2](#), [ESP32-C3](#), [ESP8266](#), and [ESP32-S2](#) Series SoCs provided for Windows, Linux, and macOS.

This document describes using ESP-AT with the ESP32-C2 SoC.

		
Get Started	AT Binary Lists	AT Command Set
		
AT Command Examples	Compile and Develop	Customized AT Commands and Firmware

Chapter 1

Get Started

This Get Started guide provides users with detailed information on what is ESP-AT, how to connect hardware, and how to download and flash AT firmware. It consists of the following parts:

1.1 What is ESP-AT

ESP-AT is a solution developed by Espressif to integrate connectivity into customers' products, which can be quickly moved to mass production. It aims to reduce software development costs and quickly form products. With ESP-AT commands, you can quickly join the wireless network, connect to the cloud platform, realize data transmission and remote control functions, and realize the interconnection of everything through wireless communication easily.

ESP-AT is a project based on ESP-IDF. It makes an ESP32-C2 board work as a slave, and an MCU as a host. The host MCU sends AT commands to the ESP32-C2 chip and receives AT responses back. ESP-AT provides a wide range of AT commands with different functions, such as Wi-Fi commands, TCP/IP commands, Bluetooth LE commands, Bluetooth commands, MQTT commands, HTTP commands, and Ethernet commands.

Fig. 1: ESP-AT Overview

AT commands start with “AT” , which stand for “Attention” , and end with a new line (CR LF). Every time you send a command, you will receive an OK or ERROR, which indicates the final execution status of the current command. Please be noted that all commands are executed serially, which means only one AT command can be executed at a time. Therefore, you should wait for the previous command to be executed before sending out the next

one. Otherwise, you will receive `busy p . . .`. For more details about AT commands, please refer to [AT Command Set](#).

By default, the host MCU connects to the ESP32-C2 board via UART, and sends/receives AT commands/responses through UART. But you can also use other interfaces, such as SDIO, according to your actual use scenario.

You can develop your own AT commands based on our ESP-AT project and implement more features according to your actual use scenario.

1.2 Hardware Connection

This document introduces what hardware you need to prepare and how to connect them in order to download AT firmware, send AT commands, and receive AT responses.

For different series of modules, the commands supported by AT firmware are different. Please refer to [ESP-AT Firmware Differences](#) for more details.

1.2.1 What You Need

Table 1: List of Components Required for ESP-AT Testing

Component	Function
ESP32-C2 board	Slave MCU.
USB cable (ESP32-C2 board to PC)	Download/Log output connection.
PC	Act as Host MCU. Download firmware to Slave MCU.
USB cable (PC to serial port converter)	AT command/response connection.
USB to serial port converter	Convert between USB signals and TTL signals.
Jumper wires (serial port converter to ESP32-C2 board)	AT command/response connection.

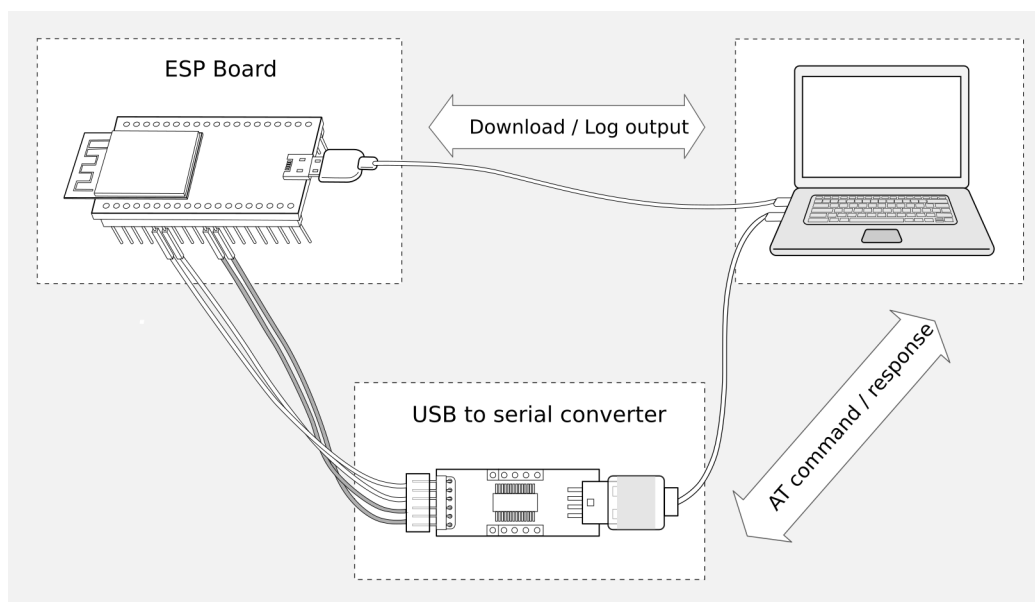

Fig. 2: Connection of Components for ESP-AT Testing

Note:

- The official default [AT Binary Lists](#) only supports 26 MHz crystal oscillator. If your crystal oscillator of ESP32-C2 is 40 MHz, please refer to [Compile ESP-AT Project](#) document to compile ESP32-C2 AT firmware, and configure in the step 5:

```
python build.py menuconfig -> Component config -> Hardware Settings -> Main_
  ↳ XTAL Config -> Main XTAL frequency -> 40 MHz
```

- In the above picture, four jump wires are used to connect the ESP32-C2 board and USB to serial converter. If you don't use hardware flow control, two wires connecting TX/RX and a simpler converter will be enough.

1.2.2 ESP32C2-4MB Series

ESP32C2-4MB series refer to the module or board that has a built-in ESP32-C2/ESP8684 chip with a 4 MB flash, such as ESP32C2-MINI series device and ESP32C2-WROOM series device.

ESP32C2-4MB AT uses two UART ports: UART0 is used to download firmware and log output; UART1 is used to send AT commands and receive AT responses. Both UART0 and UART1 use 115200 baud rate for communication by default.

Table 2: ESP32C2-4MB Series Hardware Connection Pinout

Function of Connection	ESP32C2-4MB Board Pins	Other Device Pins
Download/Log output ¹	UART0 <ul style="list-style-type: none"> • GPIO19 (RX) • GPIO20 (TX) 	PC <ul style="list-style-type: none"> • TX • RX
AT command/response ²	UART1 <ul style="list-style-type: none"> • GPIO6 (RX) • GPIO7 (TX) • GPIO5 (CTS) • GPIO4 (RTS) 	USB to serial converter <ul style="list-style-type: none"> • TX • RX • RTS • CTS

Note 1: Connection between individual pins of the ESP32C2-4MB board and the PC is already established internally on the ESP32C2-4MB board. You only need to provide USB cable between the board and PC.

Note 2: Connection between CTS/RTS is optional, depending on whether you want to use hardware flow control.

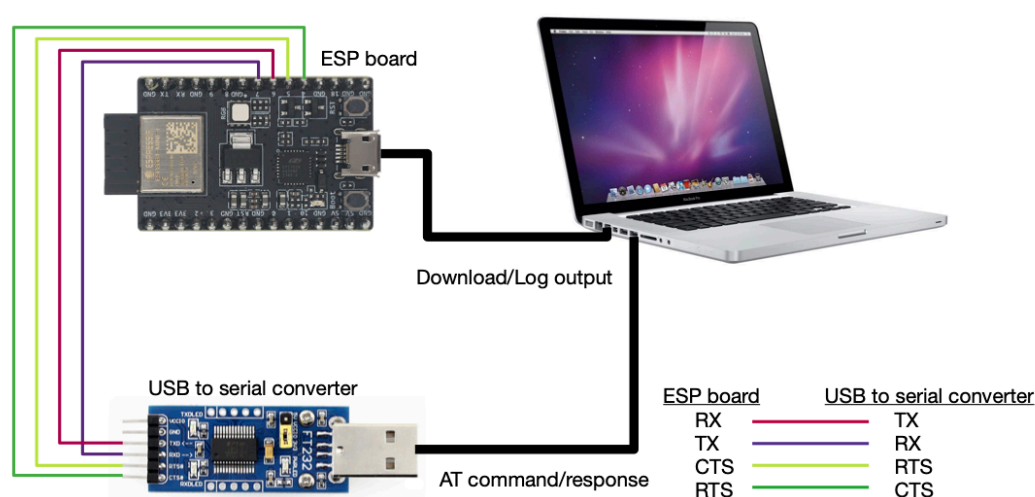

Fig. 3: ESP32C2-4MB Series Hardware Connection

If you want to connect your device directly with ESP32C2-4MB module rather than the ESP32C2-4MB board that integrates it, please refer to the corresponding module [datasheet](#) for more details.

1.2.3 ESP32C2-2MB Series

ESP32C2-2MB series refers to the module or board that has a built-in ESP32-C2/ESP8684 chip with a 2 MB flash.

ESP32C2-2MB AT uses two UART ports: UART0 is used to download firmware and log output; UART1 is used to send AT commands and receive AT responses. Both UART0 and UART1 use 115200 baud rate for communication by default.

Table 3: ESP32C2-2MB Series Hardware Connection Pinout

Function of Connection	ESP32C2-2MB Board Pins	Other Device Pins
Download/Log output ¹	UART0 <ul style="list-style-type: none"> GPIO19 (RX) GPIO20 (TX) 	PC <ul style="list-style-type: none"> TX RX
AT command/response ²	UART1 <ul style="list-style-type: none"> GPIO6 (RX) GPIO7 (TX) GPIO5 (CTS) GPIO4 (RTS) 	USB to serial converter <ul style="list-style-type: none"> TX RX RTS CTS
Log output	UART0 <ul style="list-style-type: none"> GPIO8 (TX) 	USB to serial converter <ul style="list-style-type: none"> RX

Note 1: Connection between individual pins of the ESP32C2-2MB board and the PC is already established internally on the ESP32C2-2MB board. You only need to provide USB cable between the board and PC.

Note 2: Connection between CTS/RTS is optional, depending on whether you want to use hardware flow control.

If you want to connect your device directly with ESP32C2-2MB module rather than the ESP32C2-2MB board that integrates it, please refer to the corresponding module [datasheet](#) for more details.

1.3 Downloading Guide

This Guide demonstrates how to download AT firmware and flash it into an ESP8684-MINI-1 device by taking ESP8684-MINI-1 as an example. The Guide is also applicable to other ESP32-C2 modules.

Before you start, please make sure you have already connected your hardware. For more details, see [Hardware Connection](#).

For different series of modules, the commands supported by AT firmware are different. Please refer to [ESP-AT Firmware Differences](#) for more details.

1.3.1 Download AT Firmware

To download AT firmware to your computer, please do as follows:

- Navigate to [AT Binary Lists](#)
- Find the firmware for your device
- Click the link to download it

Fig. 4: ESP32C2-2MB Series Hardware Connection

Here, we download ESP32C2-4MB_AT_Bin_V2.5.0.0 for ESP8684-MINI-1. The list below describes the structure of this firmware and what each bin file contains. Other AT firmware has similar structure and bin files.

```

•
├─ at_customize.bin           // secondary partition table
├─ bootloader                 // bootloader
│   └─ bootloader.bin
├─ customized_partitions      // AT customized binaries
│   ├── ble_data.bin
│   ├── client_ca.bin
│   ├── client_cert.bin
│   ├── client_key.bin
│   ├── factory_param.bin
│   ├── factory_param_MINI-1.bin
│   ├── mqtt_ca.bin
│   ├── mqtt_cert.bin
│   ├── mqtt_key.bin
│   ├── server_ca.bin
│   ├── server_cert.bin
│   └─ server_key.bin
├─ download.config            // configuration of downloading
├─ esp-at.bin                 // AT application binary
├─ esp-at.elf
├─ esp-at.map
├─ factory                    // A combined bin for factory downloading
│   ├── factory_MINI-1.bin
│   └─ factory_parameter.log
├─ flasher_args.json          // flasher arguments
└─ ota_data_initial.bin       // ota data parameters

```

(continues on next page)

(continued from previous page)

```
└─ partition_table                // primary partition table
└─ └─ partition-table.bin
└─ phy_init_data.bin             // phy parameters
└─ sdkconfig                     // compilation configuration for AT firmware
```

The file `download.config` contains the configuration to flash the firmware into multiple addresses:

```
--flash_mode dio --flash_freq 60m --flash_size 4MB
0x0 bootloader/bootloader.bin
0x60000 esp-at.bin
0x8000 partition_table/partition-table.bin
0xd000 ota_data_initial.bin
0xf000 phy_init_data.bin
0x1e000 at_customize.bin
0x1f000 customized_partitions/server_cert.bin
0x21000 customized_partitions/server_key.bin
0x23000 customized_partitions/server_ca.bin
0x25000 customized_partitions/client_cert.bin
0x27000 customized_partitions/client_key.bin
0x29000 customized_partitions/client_ca.bin
0x32000 customized_partitions/mqtt_cert.bin
0x34000 customized_partitions/mqtt_key.bin
0x36000 customized_partitions/mqtt_ca.bin
0x2B000 customized_partitions/factory_param.bin
```

- `--flash_mode dio` means the firmware is compiled with flash DIO mode.
- `--flash_freq 60m` means the firmware's flash frequency is 60 MHz.
- `--flash_size 4MB` means the firmware is using flash size 4 MB.
- `0xd000 ota_data_initial.bin` means downloading `ota_data_initial.bin` into the address `0xd000`.

1.3.2 Flash AT Firmware into Your Device

Follow the instructions below for your operating system.

Windows

Before starting to flash, you need to download [Flash Download Tools for Windows](#). For more details about the tools, please see the `doc` folder in the zip folder.

- Open the ESP32-C2 Flash Download Tool.
- Select chipType. (Here, we select ESP32C2.)
- Select a workMode according to your need. (Here, we select Developer Mode.)
- Select a loadMode according to your need. (Here, we select uart.)
- Flash AT firmware into your device. You can select either of the two ways below.
 - To download one combined factory bin to address 0, select “DoNotChgBin” to use the default configuration of the factory bin.
 - To download multiple bins separately to different addresses, set up the configurations according to the file `download.config` and do NOT select “DoNotChgBin”.

In case of flashing issues, please verify what the COM port number of download interface of the ESP32-C2 board is and select it from “COM:” dropdown list. If you don't know the port number, you can refer to [Check port on Windows](#) for details.

When you finish flashing, please [Check Whether AT Works](#).

Fig. 5: Firmware Download Configurations

Fig. 6: Download to One Address (click to enlarge)

Fig. 7: Download to Multiple Addresses (click to enlarge)

Linux or macOS

Before you start to flash, you need to install `esptool.py`.

You can select either of the two ways below to flash AT firmware into your device.

- To download the bins separately into multiple addresses, enter the following command and replace PORTNAME and download.config:

```
esptool.py --chip auto --port PORTNAME --baud 115200 --before default_reset --
↳after hard_reset write_flash -z download.config
```

Replace PORTNAME with your port name. If you don't know it, you can refer to [Check port on Linux and macOS](#) for details.

Replace download.config with the content inside the file.

Below is the example command for ESP8684-MINI-1.

```
esptool.py --chip auto --port /dev/tty.usbserial-0001 --baud 115200 --
↳before default_reset --after hard_reset write_flash -z --flash_mode
↳dio --flash_freq 60m --flash_size 4MB 0x0 bootloader/bootloader.bin
↳0x60000 esp-at.bin 0x8000 partition_table/partition-table.bin 0xd000
↳ota_data_initial.bin 0xf000 phy_init_data.bin 0x1e000 at_customize.
↳bin 0x1f000 customized_partitions/server_cert.bin 0x21000 customized_
↳partitions/server_key.bin 0x23000 customized_partitions/server_ca.
↳bin 0x25000 customized_partitions/client_cert.bin 0x27000 customized_
↳partitions/client_key.bin 0x29000 customized_partitions/client_ca.
↳bin 0x32000 customized_partitions/mqtt_cert.bin 0x34000 customized_
↳partitions/mqtt_key.bin 0x36000 customized_partitions/mqtt_ca.bin
↳0x2B000 customized_partitions/factory_param.bin
```

- To download the bins together to one address, enter the following command and replace PORTNAME and FILEDIRECTORY:

```
esptool.py --chip auto --port PORTNAME --baud 115200 --before default_reset --
↳after hard_reset write_flash -z --flash_mode dio --flash_freq 40m --flash_
↳size 4MB 0x0 FILEDIRECTORY
```

Replace `PORTNAME` with your port name. If you don't know it, you can refer to [Check port on Linux and macOS](#) for details.

Replace `FILEDIRECTORY` with the file directory you would flash to the address `0x0`. It is normally `factory/XXX.bin`.

Below is the example command for ESP8684-MINI-1.

```
esptool.py --chip auto --port /dev/tty.usbserial-0001 --baud 115200 --  
↪before default_reset --after hard_reset write_flash -z --flash_mode_↪  
↪dio --flash_freq 60m --flash_size 4MB 0x0 factory/factory_MINI-1.bin
```

When you finish flashing, please [Check Whether AT Works](#).

1.3.3 Check Whether AT Works

To check whether AT works, do as follows:

- Open a serial port tool, such as SecureCRT;
- Select the Port attached to “AT command/response” line (see [Hardware Connection](#) for details);
- Set Baudrate to 115200;
- Set Data Bits to 8;
- Set Parity to None;
- Set Stop Bits to 1;
- Set Flow Type to None;
- Enter the command “AT+GMR” with a new line (CR LF).

If the response is OK as the picture below shows, AT works.

```
AT+GMR  
AT version:2.5.0.0-dev(c3e8505 - ESP32C2 - Jul 11 2022 08:24:02)  
SDK version:v5.0-dev-3424-gbb23d783c0  
compile time(bc9ad31):Jul 14 2022 17:01:10  
Bin version:2.4.0(MINI-1)  
  
OK
```

Fig. 8: Response from AT

Otherwise, you need to check your ESP32-C2 startup log in one of the following ways:

Method 1:

- Open a serial port tool, such as SecureCRT;
- Select the port attached to the “Download/Log output” line. For more information on this line, see [Hardware Connection](#).
- Set Baudrate to 115200;
- Set Data Bits to 8;
- Set Parity to None;
- Set Stop Bits to 1;
- Set Flow Type to None;
- Press the RST key of the board directly. If it is like the log below, it means that ESP-AT firmware have been initialized correctly.

Method 2:

- Open two serial port tools, such as SecureCRT;
- In one serial port tool, select the port attached to the “AT command/response” line. In the other tool, select the port attached to the “Download/Log output” line. For more information on these lines, see [Hardware Connection](#).

- Set Baudrate to 115200;
- Set Data Bits to 8;
- Set Parity to None;
- Set Stop Bits to 1;
- Set Flow Type to None;
- Enter the command **AT+RST** with a new line (CR LF) to the “AT command/response” line. If the serial log from the “Download/Output log” line is like the log below, it means that ESP-AT firmware have been initialized correctly.

ESP32-C2 startup log:

```
ESP-ROM:esp8684-api2-20220127

```

To learn more about ESP-AT, please read [What is ESP-AT](#).

To get started with ESP-AT, please read [Hardware Connection](#) first to learn what hardware to prepare and how to connect them. Then, you can download and flash AT firmware into your device according to [Downloading Guide](#).

Chapter 2

AT Binary Lists

2.1 Released Firmware

It is recommended to use the latest version of firmware. Currently, Espressif only releases AT firmware for the following ESP32-C2 series of modules.

Note: If there is no released firmware for your module, you can either use the firmware for the module that has the same hardware configuration as yours (see [ESP-AT Firmware Differences](#) for which module has the same configuration), or create a factory parameter bin for your module (see [How to Generate Factory Parameter Bin](#) for details).

2.1.1 ESP32-C2 2MB Series

- [v3.0.0.0 ESP32-C2-2MB_AT_Bin_V3.0.0.0.zip](#) (Recommended)

2.1.2 ESP32-C2 4MB Series

- [v3.0.0.0 ESP32-C2-4MB_AT_Bin_V3.0.0.0.zip](#) (Recommended)

This document covers the following sections:

- [Download ESP32-C2 AT Released Firmware](#)
- [Brief Introduction to AT Firmware](#): What binary files the AT firmware contains and their functions
- [Which Type of Firmware Shall I Choose?](#): Types of AT firmware, ways to access them, their application scenarios, pros, cons, etc.
- [After Getting Firmware, What Next?](#)

Note: To download AT firmware for other chip series, please go to the drop-down list on the upper left corner of this page and select a chip series to navigate to the documentation of that chip for downloading.

2.2 Brief Introduction to AT Firmware

ESP-AT firmware contains several binaries, and each of them is dedicated to a specific function:

- `factory/factory_XXX.bin` is the combination of all binaries. So, you can either download the `factory/factory_XXX.bin` to address 0, or several binaries to different addresses according to `download.config`.
- `at_customize.bin` provides a user partition table, which lists the starting address and partition size for the `ble_data.bin`, SSL certificates, MQTT certificates, `factory_param_XXX.bin`, and so on. You can read and write the contents of the partition listed in this file with the command [AT+FS](#) and [AT+SYSFLASH](#).
- `factory_param_XXX.bin` indicates the hardware configurations for different ESP32-C2 modules (see the table below). Please make sure the correct bin is used for your module. For more information on this parameter file, please refer to [Firmware with Updated Parameters](#).

Table 1: Hardware Configuration of ESP32-C2 Modules

Modules	UART Pins (TX, RX, CTS, RTS)	Factory Parameter Bin
ESP32C2-4MB Series	<ul style="list-style-type: none"> • GPIO7 • GPIO6 • GPIO5 • GPIO4 	<code>factory_param_ESP32C2-4MB.bin</code>

- `ble_data.bin` provides Bluetooth LE services when the ESP32-C2 works as a Bluetooth LE server;
- `server_cert.bin`, `server_key.bin` and `server_ca.bin` are examples of SSL server' s certificate;
- `client_cert.bin`, `client_key.bin` and `client_ca.bin` are examples of SSL client' s certificate;
- `mqtt_cert.bin`, `mqtt_key.bin` and `mqtt_ca.bin` are examples of MQTT SSL client' s certificate;

If some of the functions are not used, then the corresponding binaries do not need downloading into flash.

2.3 Which Type of Firmware Shall I Choose?

ESP-AT firmware has the following types. Among them, the workload of downloading or preparing firmware increases from top to bottom, and so does the number of supported module types.

- [Officially Released Firmware \(Recommended\)](#)
- [GitHub Temporary Firmware](#)
- [Firmware with Updated Parameters](#)
- [Self-Compiled Firmware](#)

2.3.1 Officially Released Firmware (Recommended)

Officially released firmware, also known as “released firmware”, “official firmware” or “default firmware”, is tested and periodically released by Espressif' s official team according to the internal development plan. It can be upgraded directly based on the Espressif OTA server. If it fully matches your project needs, it is recommended to choose it over the other types of firmware. If it does not support your module, you can select a firmware that has a similar hardware configuration to your module according to [Hardware Differences](#) for testing and verification.

- How to obtain firmware: [ESP32-C2 AT firmware](#)
- Pros:
 - Stable

- Reliable
 - Small workload of obtaining firmware
- Cons:
 - Long update cycle
 - A limited number of supported modules
- Reference documentation:
 - [Hardware connection](#)
 - [Firmware Downloading and Flash](#)
 - For which chip series are supported and unsupported by ESP-AT firmware, please refer to ESP-AT GitHub home page [readme.md](#)

2.3.2 GitHub Temporary Firmware

GitHub temporary firmware is compiled by GitHub whenever code is pushed to GitHub and yet does not reach the firmware release cycle. In other words, it is the firmware in development, including the temporary versions of **officially released firmware** and supported firmware that is not planned for release. The former can be upgraded directly based on the Espressif OTA server.

- How to obtain firmware: Please refer to [How to Download the Latest Temporary Version of AT Firmware from GitHub](#).
- Pros:
 - Real-time integration of new features and bug fixes.
 - Covering some unofficially released firmware, such as firmware based on SDIO communication and firmware based on SPI communication.
 - Small workload of obtaining firmware.
- Cons: As the firmware compiled based on commits that are not for official release has not been thoroughly tested, there may be some risks. You need to do a complete test by yourself.

2.3.3 Firmware with Updated Parameters

The **firmware with updated parameters** is generated by updating the parameter area and you do not need to compile the firmware. It is suitable for the case where the firmware function meets the project requirements, but only some parameters do not, such as the factory baud rate and UART IO pins. This type of firmware can be directly upgraded based on the Espressif OTA server.

- For how to modify those parameters, please refer to [How to Generate Factory Parameter Bin](#).
- Pros:
 - No need to recompile the firmware.
 - The firmware is stable and reliable.
- Cons: Requiring modification to released firmware, long update cycle, and a limited number of supported modules.

2.3.4 Self-Compiled Firmware

When you need to conduct secondary development, you can compile the firmware by yourself. To support the OTA function, you need to deploy your own OTA server.

- For how to compile the firmware by yourself, please refer to [Compile ESP-AT Project](#).
- Pros: You can control functions and cycles.
- Cons: You need to set up the compilation environment.

2.4 After Getting Firmware, What Next?

After you get the firmware, please refer to [Hardware Connection](#) and [Firmware Downloading and Flashing Guide](#) to connect the PC and ESP device and flash the firmware to the device.

Chapter 3

AT Command Set

Here is a list of AT commands.

3.1 Basic AT Commands

- *AT*: Test AT startup.
- *AT+RST*: Restart a module.
- *AT+GMR*: Check version information.
- *AT+CMD*: List all AT commands and types supported in current firmware.
- *AT+GSLP*: Enter Deep-sleep mode.
- *ATE*: Configure AT commands echoing.
- *AT+RESTORE*: Restore factory default settings of the module.
- *AT+UART_CUR*: Current UART configuration, not saved in flash.
- *AT+UART_DEF*: Default UART configuration, saved in flash.
- *AT+SLEEP*: Set the sleep mode.
- *AT+SYSRAM*: Query current remaining heap size and minimum heap size.
- *AT+SYSMSG*: Query/Set System Prompt Information.
- *AT+SYSFLASH*: Query/Set User Partitions in Flash.
- *AT+FS*: Filesystem Operations.
- *AT+FSMOUNT*: Mount/Unmount Filesystem.
- *AT+RFPOWER*: Query/Set RF TX Power.
- *AT+SYSROLLBACK*: Roll back to the previous firmware.
- *AT+SYSTIMESTAMP*: Query/Set local time stamp.
- *AT+SYSLOG*: Enable or disable the AT error code prompt.
- *AT+SLEEPWKCFG*: Query/Set the light-sleep wakeup source and awake GPIO.
- *AT+SYSSTORE*: Query/Set parameter store mode.
- *AT+SYSREG*: Read/write the register.

3.1.1 AT: Test AT Startup

Execute Command

Command:

AT

Response:

OK

3.1.2 AT+RST: Restart a Module

Execute Command**Command:**

AT+RST

Response:

OK

3.1.3 AT+GMR: Check Version Information

Execute Command**Command:**

AT+GMR

Response:

<AT version info>
<SDK version info>
<compile time>
<Bin version>

OK

Parameters

- **<AT version info>**: information about the esp-at core library version, which is under the directory: esp-at/components/at/lib/. Code is closed source, no plan to open.
- **<SDK version info>**: information about the esp-at platform sdk version, which is defined in file: esp-at/module_config/module_{platform}_default/IDF_VERSION
- **<compile time>**: the time to compile the firmware.
- **<Bin version>**: esp-at firmware version. Version information can be modified in menuconfig.

Note

- If you have any issues on esp-at firmware, please provide AT+GMR version information firstly.

Example

AT+GMR
AT version:2.2.0.0-dev(ca41ec4 - ESP32-C2 - Sep 16 2020 11:28:17)
SDK version:v4.0.1-193-ge7ac221b4
compile time(98b95fc):Oct 29 2020 11:23:25
Bin version:2.1.0 (MINI-1)

(continues on next page)

(continued from previous page)

OK

3.1.4 AT+CMD: List all AT commands and types supported in current firmware

Query Command

Command:

AT+CMD?

Response:

+CMD:<index>,<AT command name>,<support test command>,<support query command>,
↔<support set command>,<support execute command>

OK

Parameters

- **<index>**: AT command sequence number.
- **<AT command name>**: AT command name.
- **<support test command>**: 0 means not supported, 1 means supported.
- **<support query command>**: 0 means not supported, 1 means supported.
- **<support set command>**: 0 means not supported, 1 means supported.
- **<support execute command>**: 0 means not supported, 1 means supported.

3.1.5 AT+GSLP: Enter Deep-sleep Mode

Set Command

Command:

AT+GSLP=<time>

Response:

<time>

OK

Parameter

- **<time>**: the duration when the device stays in Deep-sleep. Unit: millisecond. When the time is up, the device automatically wakes up, calls Deep-sleep wake stub, and then proceeds to load the application.
 - 0 means restarting right now
 - the maximum Deep-sleep time is about 28.8 days ($2^{31}-1$ milliseconds)

Notes

- The theoretical and actual time of Deep-sleep may be different due to external factors.

3.1.6 ATE: Configure AT Commands Echoing

Execute Command

Command:

ATE0

or

ATE1

Response:

OK

Parameters

- **ATE0:** Switch echo off.
- **ATE1:** Switch echo on.

3.1.7 AT+RESTORE: Restore Factory Default Settings

Execute Command

Command:

AT+RESTORE

Response:

OK

Notes

- The execution of this command will restore all parameters saved in flash to factory default settings of the module.
- The device will be restarted when this command is executed.

3.1.8 AT+UART_CUR: Current UART Configuration, Not Saved in Flash

Query Command

Command:

AT+UART_CUR?

Response:

+UART_CUR:<baudrate>,<databits>,<stopbits>,<parity>,<flow control>

OK

Set Command

Command:

```
AT+UART_CUR=<baudrate>,<databits>,<stopbits>,<parity>,<flow control>
```

Response:

```
OK
```

Parameters

- **<baudrate>**: UART baud rate
 - For ESP32-C2 devices, the supported range is 80 ~ 5000000.
- **<databits>**: data bits
 - 5: 5-bit data
 - 6: 6-bit data
 - 7: 7-bit data
 - 8: 8-bit data
- **<stopbits>**: stop bits
 - 1: 1-bit stop bit
 - 2: 1.5-bit stop bit
 - 3: 2-bit stop bit
- **<parity>**: parity bit
 - 0: None
 - 1: Odd
 - 2: Even
- **<flow control>**: flow control
 - 0: flow control is not enabled
 - 1: enable RTS
 - 2: enable CTS
 - 3: enable both RTS and CTS

Notes

- The Query Command will return actual values of UART configuration parameters, which may have minor differences from the set value because of the clock division.
- The configuration changes will NOT be saved in flash.
- To use hardware flow control, you need to connect CTS/RTS pins of your ESP32-C2. For more details, please refer to [Hardware Connection](#) or `components/customized_partitions/raw_data/factory_param/factory_param_data.csv`.

Example

```
AT+UART_CUR=115200,8,1,0,3
```

3.1.9 AT+UART_DEF: Default UART Configuration, Saved in Flash

Query Command

Command:

```
AT+UART_DEF?
```

Response:

```
+UART_DEF:<baudrate>,<databits>,<stopbits>,<parity>,<flow control>
```

```
OK
```

Set Command**Command:**

```
AT+UART_DEF=<baudrate>,<databits>,<stopbits>,<parity>,<flow control>
```

Response:

```
OK
```

Parameters

- **<baudrate>**: UART baud rate
 - For ESP32-C2 devices, the supported range is 80 ~ 5000000.
- **<databits>**: data bits
 - 5: 5-bit data
 - 6: 6-bit data
 - 7: 7-bit data
 - 8: 8-bit data
- **<stopbits>**: stop bits
 - 1: 1-bit stop bit
 - 2: 1.5-bit stop bit
 - 3: 2-bit stop bit
- **<parity>**: parity bit
 - 0: None
 - 1: Odd
 - 2: Even
- **<flow control>**: flow control
 - 0: flow control is not enabled
 - 1: enable RTS
 - 2: enable CTS
 - 3: enable both RTS and CTS

Notes

- The configuration changes will be saved in the NVS area, and will still be valid when the chip is powered on again.
- To use hardware flow control, you need to connect CTS/RTS pins of your ESP32-C2. For more details, please refer to [Hardware Connection](#) or `components/customized_partitions/raw_data/factory_param/factory_param_data.csv`.

Example

```
AT+UART_DEF=115200,8,1,0,3
```

3.1.10 AT+SLEEP: Set the Sleep Mode

Query Command

Command:

```
AT+SLEEP?
```

Response:

```
+SLEEP:<sleep mode>
```

```
OK
```

Set Command

Command:

```
AT+SLEEP=<sleep mode>
```

Response:

```
OK
```

Parameter

- **<sleep mode>:**
 - 0: Disable the sleep mode.
 - 1: Modem-sleep mode.
 - * Only Wi-Fi mode.
 - RF will be periodically closed according to AP DTIM.
 - * Only BLE mode.
 - RF will be periodically closed according to advertising interval (BLE state in advertising).
 - RF will be periodically closed according to connection interval (BLE state in connection).
 - 2: Light-sleep mode.
 - * Only Wi-Fi mode.
 - CPU will automatically sleep and RF will be periodically closed according to `listen interval` set by [AT+CWJAP](#).
 - * Only BLE mode.
 - CPU will automatically sleep and RF will be periodically closed according to advertising interval (BLE state in advertising).
 - CPU will automatically sleep and RF will be periodically closed according to connection interval (BLE state in connection).
 - 3: Modem-sleep listen interval mode.
 - * Only Wi-Fi mode.
 - RF will be periodically closed according to `listen interval` set by [AT+CWJAP](#).
 - * Only BLE mode.
 - RF will be periodically closed according to advertising interval (BLE state in advertising).
 - RF will be periodically closed according to connection interval (BLE state in connection).

Note

- When sleep mode is disabled, you cannot initialize Bluetooth LE. When Bluetooth LE is initialized, you cannot disable sleep mode.
- Modem-sleep mode and Light-sleep mode can be set under Wi-Fi mode or BLE mode, but in Wi-Fi mode, these two modes can only be set in `station` mode.

- Before setting the Light-sleep mode, it is recommended to set the wakeup source in advance through the command *AT+SLEEPWKCFG*, otherwise ESP32-C2 can't wake up and will always be in sleep mode.
- After setting the Light-sleep mode, if the Light-sleep wakeup condition is not met, ESP32-C2 will automatically enter the sleep mode. When the Light-sleep wakeup condition is met, ESP32-C2 will automatically wake up from sleep mode.
- For Light-sleep mode in BLE mode, users must ensure external 32KHz crystal oscillator, otherwise the Light-sleep mode will work in Modem-sleep mode.
- For more examples, please refer to *Sleep AT Examples*.

Example

```
AT+SLEEP=0
```

3.1.11 AT+SYSRAM: Query Current Remaining Heap Size and Minimum Heap Size

Query Command

Command:

```
AT+SYSRAM?
```

Response:

```
+SYSRAM:<remaining RAM size>,<minimum heap size>  
OK
```

Parameters

- **<remaining RAM size>**: current remaining heap size. Unit: byte.
- **<minimum heap size>**: minimum available heap size in the runtime. Unit: byte. When the parameter's value is less than or close to 10 KB, the Wi-Fi and BLE functions of ESP32-C2 may be affected.

Example

```
AT+SYSRAM?  
+SYSRAM:148408,84044  
OK
```

3.1.12 AT+SYSMMSG: Query/Set System Prompt Information

Query Command

Function:

Query the current system prompt information state.

Command:

```
AT+SYSMMSG?
```

Response:

```
+SYSMMSG:<state>  
OK
```

Set Command

Function:

Configure system prompt information.

Command:

```
AT+SYSMSG=<state>
```

Response:

```
OK
```

Parameter

- **<state>:**
 - Bit0: Prompt information when quitting Wi-Fi *Passthrough Mode*, Bluetooth LE SPP and Bluetooth SPP.
 - * 0: Print no prompt information when quitting Wi-Fi *Passthrough Mode*, Bluetooth LE SPP and Bluetooth SPP.
 - * 1: Print +QUITT when quitting Wi-Fi *Passthrough Mode*, Bluetooth LE SPP and Bluetooth SPP.
 - Bit1: Connection prompt information type.
 - * 0: Use simple prompt information, such as XX, CONNECT.
 - * 1: Use detailed prompt information, such as +LINK_CONN:status_type,link_id,ip_type,terminal_type,remote_ip,remote_port,local_port.
 - Bit2: Connection status prompt information for Wi-Fi *Passthrough Mode*, Bluetooth LE SPP and Bluetooth SPP.
 - * 0: Print no prompt information.
 - * 1: Print one of the following prompt information when Wi-Fi, socket, Bluetooth LE or Bluetooth status is changed:

```
- "CONNECT\r\n" or the message prefixed with "+LINK_CONN:"
- "CLOSED\r\n"
- "WIFI CONNECTED\r\n"
- "WIFI GOT IP\r\n"
- "WIFI GOT IPv6 LL\r\n"
- "WIFI GOT IPv6 GL\r\n"
- "WIFI DISCONNECT\r\n"
- "+ETH_CONNECTED\r\n"
- "+ETH_DISCONNECTED\r\n"
- the message prefixed with "+ETH_GOT_IP:"
- the message prefixed with "+STA_CONNECTED:"
- the message prefixed with "+STA_DISCONNECTED:"
- the message prefixed with "+DIST_STA_IP:"
- the message prefixed with "+BLECONN:"
- the message prefixed with "+BLEDISCONN:"
```

Notes

- The configuration changes will be saved in the NVS area if AT+SYSSTORE=1.
- If you set Bit0 to 1, it will prompt "+QUITT" when you quit Wi-Fi *Passthrough Mode*.
- If you set Bit1 to 1, it will impact the information of command *AT+CIPSTART* and *AT+CIPSERVER*. It will supply "+LINK_CONN:status_type,link_id,ip_type,terminal_type,remote_ip,remote_port,local_port" instead of "XX,CONNECT" .

Example

```
// print no prompt info when quitting Wi-Fi passthrough mode
// print detailed connection prompt info
// print no prompt info when the connection status is changed
AT+SYSMMSG=2
```

or

```
// In the transparent transmission mode, a prompt message will be printed when the
↳Wi-Fi, socket, Bluetooth LE or Bluetooth status changes
AT+SYSMMSG=4
```

3.1.13 AT+SYSFLASH: Query/Set User Partitions in Flash

Query Command

Function:

Query user partitions in flash.

Command:

```
AT+SYSFLASH?
```

Response:

```
+SYSFLASH:<partition>,<type>,<subtype>,<addr>,<size>
OK
```

Set Command

Function:

Read/write the user partitions in flash.

Command:

```
AT+SYSFLASH=<operation>,<partition>,<offset>,<length>
```

Response:

```
+SYSFLASH:<length>,<data>
OK
```

Parameters

- **<operation>**:
 - 0: erase sector
 - 1: write data into the user partition
 - 2: read data from the user partition
- **<partition>**: name of user partition
- **<offset>**: offset of user partition
- **<length>**: data length
- **<type>**: type of user partition
- **<subtype>**: subtype of user partition
- **<addr>**: address of user partition
- **<size>**: size of user partition

Notes

- Please make sure that you have downloaded `at_customize.bin` before using this command. For more details, please refer to [How to Customize Partitions](#).
- Before downloading the secondary user partition, please refer [How to Generate PKI Files](#) to generate the binary user partition file.
- When erasing the targeted user partition in its entirety, you can omit the parameters `<offset>` and `<length>`. For example, command `AT+SYSFLASH=0, "ble_data"` can erase the entire “ble_data” user partition. But if you want to keep the two parameters, they have to be 4KB-aligned.
- The introduction to partitions is in [ESP-IDF Partition Tables](#).
- If the operator is `write`, wrap `return >` after the write command, then you can send the data that you want to write. The length should be parameter `<length>`.
- If the operator is `write`, please make sure that you have already erased this partition.
- If the operator is `write` on a [PKI bin](#), the `<length>` should be 4 bytes aligned.

Example

```
// read 100 bytes from the "ble_data" partition offset 0.
AT+SYSFLASH=2, "ble_data", 0, 100

// write 10 bytes to the "ble_data" partition offset 100.
AT+SYSFLASH=1, "ble_data", 100, 10

// erase 8192 bytes from the "ble_data" partition offset 4096.
AT+SYSFLASH=0, "ble_data", 4096, 8192
```

3.1.14 AT+FS: Filesystem Operations

Set Command

Command:

```
AT+FS=<type>, <operation>, <filename>, <offset>, <length>
```

Response:

```
OK
```

Parameters

- **<type>**: only FATFS is currently supported.
 - 0: FATFS
- **<operation>**:
 - 0: delete file.
 - 1: write file.
 - 2: read file.
 - 3: query the size of the file.
 - 4: list files in a specific directory. Only root directory is currently supported.
- **<offset>**: apply to writing and reading operations only.
- **<length>**: data length, applying to writing and reading operations only.

Notes

- This command will automatically mount the filesystem. After the `AT+FS` filesystem operation is all done, it is strongly recommended to use the `AT+FSMOUNT=0` command to unmount the filesystem to free a large

amount of RAM space.

- Please make sure that you have downloaded `at_customize.bin` before using this command. For more details, refer to [ESP-IDF Partition Tables](#) and [How to Customize Partitions](#).
- If the length of the read data is greater than the actual file length, only the actual data length of the file will be returned.
- If the operator is `write`, wrap return `>` after the write command, then you can send the data that you want to write. The length should be parameter `<length>`.

Example

```
// delete a file.
AT+FS=0,0,"filename"

// write 10 bytes to offset 100 of a file.
AT+FS=0,1,"filename",100,10

// read 100 bytes from offset 0 of a file.
AT+FS=0,2,"filename",0,100

// list all files in the root directory.
AT+FS=0,4,"."
```

3.1.15 AT+FSMOUNT: Mount/Unmount Filesystem

Set Command

Command:

```
AT+FSMOUNT=<mount>
```

Response:

```
OK
```

Parameters

- **<mount>**:
 - 0: Unmount filesystem
 - 1: Mount filesystem

Notes

- After the `AT+FS` filesystem operation is all done, it is strongly recommended to use the `AT+FSMOUNT=0` command to unmount the filesystem to free a large amount of RAM space.

Example

```
// unmount the filesystem manually
AT+FSMOUNT=0

// mount the filesystem manually
AT+FSMOUNT=1
```

3.1.16 AT+RFPOWER: Query/Set RF TX Power

Query Command

Function:

Query the RF TX Power.

Command:

```
AT+RFPOWER?
```

Response:

```
+RFPOWER:<wifi_power>
OK
```

Set Command

Command:

```
AT+RFPOWER=<wifi_power>
```

Response:

```
OK
```

Parameters

- **<wifi_power>**: the unit is 0.25 dBm. For example, if you set the value to 78, the actual maximum RF Power value is $78 * 0.25 \text{ dBm} = 19.5 \text{ dBm}$. After you configure it, please confirm the actual value by entering the command AT+RFPOWER?.
 - For ESP32-C2 devices, the range is [40,84]:

set value	get value	actual value	actual dBm
[40,80]	<set value>	<set value>	<set value> * 0.25
[81,84]	<set value>	80	20

3.1.17 Note

- Since the RF TX Power is actually divided into several levels, and each level has its own value range, the wifi_power value queried by the esp_wifi_get_max_tx_power may differ from the value set by esp_wifi_set_max_tx_power and is no larger than the set value.

3.1.18 AT+SYSROLLBACK: Roll Back to the Previous Firmware

Execute Command

Command:

```
AT+SYSROLLBACK
```

Response:

```
OK
```

Note

- ESP32C2-4MB AT firmware supports this command, but ESP32C2-2MB AT firmware does not due to the compressed OTA firmware.
- This command will not upgrade via OTA. It only rolls back to the firmware which is in the other OTA partition.

3.1.19 AT+SYSTIMESTAMP: Query/Set Local Time Stamp

Query Command**Function:**

Query the time stamp.

Command:

```
AT+SYSTIMESTAMP?
```

Response:

```
+SYSTIMESTAMP:<Unix_timestamp>
OK
```

Set Command**Function:**

Set local time stamp. It will be the same as SNTP time when the SNTP time is updated.

Command:

```
AT+SYSTIMESTAMP=<Unix_timestamp>
```

Response:

```
OK
```

Parameter

- **<Unix-timestamp>**: Unix timestamp. Unit: second.

Example

```
AT+SYSTIMESTAMP=1565853509 //2019-08-15 15:18:29
```

3.1.20 AT+SYSLOG: Enable or Disable the AT Error Code Prompt

Query Command**Function:**

Query whether the AT error code prompt is enabled or not.

Command:

```
AT+SYSLOG?
```

Response:

```
+SYSLOG:<status>

OK
```

Set Command**Function:**

Enable or disable the AT error code prompt.

Command:

```
AT+SYSLOG=<status>
```

Response:

```
OK
```

Parameter

- **<status>**: enable or disable
 - 0: disable
 - 1: enable

Example

```
// enable AT error code prompt
AT+SYSLOG=1

OK
AT+FAKE
ERR CODE:0x01090000

ERROR
```

```
// disable AT error code prompt
AT+SYSLOG=0

OK
AT+FAKE
// No `ERR CODE:0x01090000`

ERROR
```

The error code is a 32-bit hexadecimal value and defined as follows:

category	subcategory	extension
bit32 ~ bit24	bit23 ~ bit16	bit15 ~ bit0

- **category**: stationary value 0x01.

- **subcategory:** error type.

Table 1: Subcategory of Error Code

Error Type	Error Code	Description
ESP_AT_SUB_OK	0x00	OK
ESP_AT_SUB_COMMON_ERROR	0x01	reserved
ESP_AT_SUB_NO_TERMINATOR	0x02	terminator character not found (“rn” expected)
ESP_AT_SUB_NO_AT	0x03	Starting AT not found (or at, At or aT entered)
ESP_AT_SUB_PARA_LENGTH_MISMATCH	0x04	parameter length mismatch
ESP_AT_SUB_PARA_TYPE_MISMATCH	0x05	parameter type mismatch
ESP_AT_SUB_PARA_NUM_MISMATCH	0x06	parameter number mismatch
ESP_AT_SUB_PARA_INVALID	0x07	the parameter is invalid
ESP_AT_SUB_PARA_PARSE_FAIL	0x08	parse parameter fail
ESP_AT_SUB_UNSUPPORTED_CMD	0x09	the command is not supported
ESP_AT_SUB_CMD_EXEC_FAIL	0x0A	the command execution failed
ESP_AT_SUB_CMD_PROCESSING	0x0B	processing of previous command is in progress
ESP_AT_SUB_CMD_OP_ERROR	0x0C	the command operation type is error

- **extension:** error extension information. There are different extensions for different subcategory. For more information, please see the `components/at/include/esp_at.h`.

For example, the error code `ERR_CODE:0x01090000` means the command is not supported.

3.1.21 AT+SLEEPWKCFG: Set the Light-sleep Wakeup Source and Awake GPIO

Set Command

Command:

```
AT+SLEEPWKCFG=<wakeup source>,<param1>[,<param2>]
```

Response:

```
OK
```

Parameters

- **<wakeup source>:**
 - 0: wakeup by a timer.
 - 1: reserved.
 - 2: wakeup by GPIO.
- **<param1>:**
 - If the wakeup source is a timer, it means the time before wakeup. Unit: millisecond.
 - If the wakeup source is GPIO, it means the GPIO number.
- **<param2>:**
 - If the wakeup source is GPIO, it means the wakeup level:
 - 0: low level.
 - 1: high level.

Example

```
// Timer wakeup
AT+SLEEPWKCFG=0,1000

// GPIO12 wakeup, low level
AT+SLEEPWKCFG=2,12,0
```

3.1.22 AT+SYSSTORE: Query/Set Parameter Store Mode**Query Command****Function:**

Query the AT parameter store mode.

Command:

```
AT+SYSSTORE?
```

Response:

```
+SYSSTORE:<store_mode>

OK
```

Set Command**Command:**

```
AT+SYSSTORE=<store_mode>
```

Response:

```
OK
```

Parameter

- **<store_mode>:**
 - 0: command configuration is not stored into flash.
 - 1: command configuration is stored into flash. (Default)

Note

- This command affects set commands only. Query commands are always fetched from RAM.
- Affected commands:

- [AT+SYMSMG](#)
- [AT+CWMODE](#)
- [AT+CIPV6](#)
- [AT+CWJAP](#)
- [AT+CWSAP](#)
- [AT+CWRECONNCFG](#)
- [AT+CIPAP](#)
- [AT+CIPSTA](#)

- *AT+CIPAPMAC*
- *AT+CIPSTAMAC*
- *AT+CIPDNS*
- *AT+CIPSSLCONF*
- *AT+CIPRECONNINTV*
- *AT+CIPTCPOPT*
- *AT+CWDHCPS*
- *AT+CWDHCP*
- *AT+CWSTAPROTO*
- *AT+CWAPPROTO*
- *AT+CWJEAP*

Examples

```
AT+SYSSTORE=0
AT+CWMODE=1 // Not stored into flash
AT+CWJAP="test", "1234567890" // Not stored into flash

AT+SYSSTORE=1
AT+CWMODE=3 // Stored into flash
AT+CWJAP="test", "1234567890" // Stored into flash
```

3.1.23 AT+SYSREG: Read/Write the Register

Set Command

Command:

```
AT+SYSREG=<direct>,<address>[,<write value>]
```

Response:

```
+SYSREG:<read value> // Only in read mode
OK
```

Parameters

- **<direct>**: read or write register.
 - 0: read register.
 - 1: write register.
- **<address>**: (uint32) register address. You can refer to Technical Reference Manuals.
- **<write value>**: (uint32) write value (only in write mode).

Note

- AT does not check address. Make sure that the registers you are operating on are valid.

3.2 Wi-Fi AT Commands

- *AT+CWMODE*: Set the Wi-Fi mode (Station/SoftAP/Station+SoftAP).
- *AT+CWSTATE*: Query the Wi-Fi state and Wi-Fi information.
- *AT+CWJAP*: Connect to an AP.

- *AT+CWRECONNCFG*: Query/Set the Wi-Fi reconnecting configuration.
- *AT+CWLAPOPT*: Set the configuration for the command *AT+CWLAP*.
- *AT+CWLAP*: List available APs.
- *AT+CWQAP*: Disconnect from an AP.
- *AT+CWSAP*: Query/Set the configuration of an ESP32-C2 SoftAP.
- *AT+CWLIF*: Obtain IP address of the station that connects to an ESP32-C2 SoftAP.
- *AT+CWQIF*: Disconnect stations from an ESP32-C2 SoftAP.
- *AT+CWDHCP*: Enable/disable DHCP.
- *AT+CWDHCPs*: Query/Set the IPv4 addresses allocated by an ESP32-C2 SoftAP DHCP server.
- *AT+CWAUTOCONN*: Connect to an AP automatically when powered on.
- *AT+CWAPPROTO*: Query/Set the 802.11 b/g/n protocol standard of SoftAP mode.
- *AT+CWSTAPROTO*: Query/Set the 802.11 b/g/n protocol standard of station mode.
- *AT+CIPSTAMAC*: Query/Set the MAC address of an ESP32-C2 station.
- *AT+CIPAPMAC*: Query/Set the MAC address of an ESP32-C2 SoftAP.
- *AT+CIPSTA*: Query/Set the IP address of an ESP32-C2 station.
- *AT+CIPAP*: Query/Set the IP address of an ESP32-C2 SoftAP.
- *AT+CWSTARTSMART*: Start SmartConfig.
- *AT+CWSTOPSMART*: Stop SmartConfig.
- *AT+WPS*: Enable the WPS function.
- *AT+MDNS*: Configure the mDNS function.
- *AT+CWJEAP*: Connect to a WPA2 Enterprise AP.
- *AT+CWHOSTNAME*: Query/Set the host name of an ESP32-C2 station.
- *AT+CWCOUNTRY*: Query/Set the Wi-Fi Country Code.

3.2.1 AT+CWMODE: Query/Set the Wi-Fi Mode (Station/SoftAP/Station+SoftAP)

Query Command

Function:

Query the Wi-Fi mode of ESP32-C2.

Command:

```
AT+CWMODE?
```

Response:

```
+CWMODE:<mode>
OK
```

Set Command

Function:

Set the Wi-Fi mode of ESP32-C2.

Command:

```
AT+CWMODE=<mode>[,<auto_connect>]
```

Response:

```
OK
```

Parameters

- **<mode>**:

- 0: Null mode. Wi-Fi RF will be disabled.
- 1: Station mode.
- 2: SoftAP mode.
- 3: SoftAP+Station mode.
- **<auto_connect>**: Enable or disable automatic connection to an AP when you change the mode of the ESP32-C2 from the SoftAP mode or null mode to the station mode or the SoftAP+Station mode. Default: 1. If you omit the parameter, the default value will be used, i.e. automatically connecting to an AP.
 - 0: The ESP32-C2 will not automatically connect to an AP.
 - 1: The ESP32-C2 will automatically connect to an AP if the configuration to connect to the AP has already been saved in flash before.

Note

- The configuration changes will be saved in the NVS area if [*AT+SYSTORE=1*](#).

Example

```
AT+CWMODE=3
```

3.2.2 AT+CWSTATE: Query the Wi-Fi state and Wi-Fi information

Query Command

Function:

Query the Wi-Fi state and Wi-Fi information of ESP32-C2.

Command:

```
AT+CWSTATE?
```

Response:

```
+CWSTATE:<state>,<"ssid">
```

```
OK
```

Parameters

- **<state>**: current Wi-Fi state.
 - 0: ESP32-C2 station has not started any Wi-Fi connection.
 - 1: ESP32-C2 station has connected to an AP, but does not get an IPv4 address yet.
 - 2: ESP32-C2 station has connected to an AP, and got an IPv4 address.
 - 3: ESP32-C2 station is in Wi-Fi connecting or reconnecting state.
 - 4: ESP32-C2 station is in Wi-Fi disconnected state.
- **<"ssid">**: the SSID of the target AP.

Note

- When ESP32-C2 station is not connected to an AP, it is recommended to use this command to query Wi-Fi information; after ESP32-C2 station is connected to an AP, it is recommended to use [*AT+CWJAP*](#) to query Wi-Fi information.

3.2.3 AT+CWJAP: Connect to an AP

Query Command

Function:

Query the AP to which the ESP32-C2 Station is already connected.

Command:

```
AT+CWJAP?
```

Response:

```
+CWJAP:<ssid>,<bssid>,<channel>,<rssi>,<pci_en>,<reconn_interval>,<listen_interval>  
↪,<scan_mode>,<pmf>  
OK
```

Set Command

Function:

Connect an ESP32-C2 station to a targeted AP.

Command:

```
AT+CWJAP=[<ssid>],[<pwd>][,<bssid>][,<pci_en>][,<reconn_interval>][,<listen_  
↪interval>][,<scan_mode>][,<jap_timeout>][,<pmf>]
```

Response:

```
WIFI CONNECTED  
WIFI GOT IP  
  
OK  
[WIFI GOT IPv6 LL]  
[WIFI GOT IPv6 GL]
```

or

```
+CWJAP:<error code>  
ERROR
```

Execute Command

Function:

Connect an ESP32-C2 station to a targeted AP with last Wi-Fi configuration.

Command:

```
AT+CWJAP
```

Response:

```
WIFI CONNECTED  
WIFI GOT IP  
  
OK  
[WIFI GOT IPv6 LL]  
[WIFI GOT IPv6 GL]
```

or

```
+CWJAP:<error code>
ERROR
```

Parameters

- **<ssid>**: the SSID of the target AP.
 - Escape character syntax is needed if SSID or password contains special characters, such , , " , or \\.
- **<pwd>**: password, MAX: 63-byte ASCII.
- **<bssid>**: the MAC address of the target AP. It cannot be omitted when multiple APs have the same SSID.
- **<channel>**: channel.
- **<rssi>**: signal strength.
- **<pci_en>**: PCI Authentication.
 - 0: The ESP32-C2 station will connect APs with all encryption methods, including OPEN and WEP.
 - 1: The ESP32-C2 station will connect APs with all encryption methods, except OPEN and WEP.
- **<reconn_interval>**: the interval between Wi-Fi reconnections. Unit: second. Default: 1. Maximum: 7200.
 - 0: The ESP32-C2 station will not reconnect to the AP when disconnected.
 - [1,7200]: The ESP32-C2 station will reconnect to the AP at the specified interval when disconnected.
- **<listen_interval>**: the interval of listening to the AP's beacon. Unit: AP beacon intervals. Default: 3. Range: [1,100].
- **<scan_mode>**:
 - 0: fast scan. It will end after finding the targeted AP. The ESP32-C2 station will connect to the first scanned AP.
 - 1: all-channel scan. It will end after all the channels are scanned. The device will connect to the scanned AP with the strongest signal.
- **<jap_timeout>**: maximum timeout for [AT+CWJAP](#) command. Unit: second. Default: 15. Range: [3,600].
- **<pmf>**: Protected Management Frames. Default: 1.
 - 0 means disable PMF.
 - bit 0: PMF capable, advertizes support for protected management frame. Device will prefer to connect in PMF mode if other device also advertizes PMF capability.
 - bit 1: PMF required, advertizes that protected management frame is required. Device will not associate to non-PMF capable devices.
- **<error code>**: (for reference only)
 - 1: connection timeout.
 - 2: wrong password.
 - 3: cannot find the target AP.
 - 4: connection failed.
 - others: unknown error occurred.

Notes

- The configuration changes will be saved in the NVS area if [AT+SYSTORE=1](#).
- This command requires Station mode to be enabled.
- After ESP32-C2 station is connected to an AP, it is recommended to use this command to query Wi-Fi information; when ESP32-C2 station is not connected to an AP, it is recommended to use [AT+CWSTATE](#) to query Wi-Fi information.
- The parameter **<reconn_interval>** of this command is the same as **<interval_second>** of the command [AT+CWRECONNCFG](#). Therefore, if you omit **<reconn_interval>** when running this command, the interval between Wi-Fi reconnections will use the default value 1.
- If the **<ssid>** and **<password>** parameter are omitted, AT will use the last configuration.
- Execute command has the same maximum timeout to setup command. The default value is 15 seconds, but you can change it by setting the parameter **<jap_timeout>**.
- To get an IPv6 address, you need to set [AT+CIPV6=1](#).
- Response OK means that the IPv4 network is ready, but not the IPv6 network. At present, ESP-AT is mainly based on IPv4 network, supplemented by IPv6 network.

- `WIFI GOT IPv6 LL` represents that the linklocal IPv6 address has been obtained. This address is calculated locally through EUI-64 and does not require the participation of the AP. Because of the parallel timing, this print may be before or after OK.
- `WIFI GOT IPv6 GL` represents that the global IPv6 address has been obtained. This address is combined by the prefix issued by AP and the suffix calculated internally, which requires the participation of the AP. Because of the parallel timing, this print may be before or after OK, or it may not be printed because the AP does not support IPv6.

Example

```
// If the target AP's SSID is "abc" and the password is "0123456789", the command
↪should be:
AT+CWJAP="abc", "0123456789"

// If the target AP's SSID is "ab\,c" and the password is "0123456789\"", the
↪command should be:
AT+CWJAP="ab\\,c", "0123456789\\"

// If multiple APs all have the SSID of "abc", the target AP can be found by BSSID:
AT+CWJAP="abc", "0123456789", "ca:d7:19:d8:a6:44"

// If esp-at is required that connect to a AP by protected management frame, the
↪command should be:
AT+CWJAP="abc", "0123456789",,,,,,3
```

3.2.4 AT+CWRECONNCFG: Query/Set the Wi-Fi Reconnecting Configuration

Query Command

Function:

Query the configuration of Wi-Fi reconnect.

Command:

```
AT+CWRECONNCFG?
```

Response:

```
+CWRECONNCFG:<interval_second>,<repeat_count>
OK
```

Set Command

Function:

Set the configuration of Wi-Fi reconnect.

Command:

```
AT+CWRECONNCFG=<interval_second>,<repeat_count>
```

Response:

```
OK
```

Parameters

- **<interval_second>**: the interval between Wi-Fi reconnections. Unit: second. Default: 0. Maximum: 7200.
 - 0: The ESP32-C2 station will not reconnect to the AP when disconnected.
 - [1,7200]: The ESP32-C2 station will reconnect to the AP at the specified interval when disconnected.
- **<repeat_count>**: the number of attempts the ESP32-C2 makes to reconnect to the AP. This parameter only works when the parameter **<interval_second>** is not 0. Default: 0. Maximum: 1000.
 - 0: The ESP32-C2 station will always try to reconnect to AP.
 - [1,1000]: The ESP32-C2 station will attempt to reconnect to AP for the specified times.

Example

```
// The ESP32-C2 station tries to reconnect to AP at the interval of one second for
↪100 times.
AT+CWRECONNCFG=1,100

// The ESP32-C2 station will not reconnect to AP when disconnected.
AT+CWRECONNCFG=0,0
```

Notes

- The parameter **<interval_second>** of this command is the same as the parameter **[<reconn_interval>]** of the command **AT+CWJAP**.
- This command works for passive disconnection from APs, Wi-Fi mode switch, and Wi-Fi auto connect after power on.

3.2.5 AT+CWLAPOPT: Set the Configuration for the Command AT+CWLAP

Set Command

Command:

```
AT+CWLAPOPT=<reserved>,<print mask>[,<rssi filter>][,<authmode mask>]
```

Response:

```
OK
```

or

```
ERROR
```

Parameters

- **<reserved>**: reserved item.
- **<print mask>**: determine whether the following parameters are shown in the result of **AT+CWLAP**. Default: 0x7FF. If you set them to 1, it means showing the corresponding parameters; if you set them as 0, it means NOT showing the corresponding parameters.
 - bit 0: determine whether **<ecn>** will be shown.
 - bit 1: determine whether **<ssid>** will be shown.
 - bit 2: determine whether **<rssi>** will be shown.
 - bit 3: determine whether **<mac>** will be shown.
 - bit 4: determine whether **<channel>** will be shown.
 - bit 5: determine whether **<freq_offset>** will be shown.
 - bit 6: determine whether **<freqcal_val>** will be shown.

- bit 7: determine whether <pairwise_cipher> will be shown.
- bit 8: determine whether <group_cipher> will be shown.
- bit 9: determine whether <bgn> will be shown.
- bit 10: determine whether <wps> will be shown.
- [**<rssi filter>**]: determine whether the result of the command *AT+CWLAP* will be filtered according to `rssi filter`. In other words, the result of the command will **NOT** show the APs whose signal strength is below `rssi filter`. Unit: dBm. Default: -100. Range: [-100,40].
- [**<authmode mask>**]: determine whether APs with the following authmodes are shown in the result of *AT+CWLAP*. Default: 0xFFFF. If you set bit `x` to 1, the APs with the corresponding authmode will be shown. If you set bit `x` to 0, the APs with the corresponding authmode will NOT be shown;
 - bit 0: determine whether APs with OPEN authmode will be shown.
 - bit 1: determine whether APs with WEP authmode will be shown.
 - bit 2: determine whether APs with WPA_PSK authmode will be shown.
 - bit 3: determine whether APs with WPA2_PSK authmode will be shown.
 - bit 4: determine whether APs with WPA_WPA2_PSK authmode will be shown.
 - bit 5: determine whether APs with WPA2_ENTERPRISE authmode will be shown.
 - bit 6: determine whether APs with WPA3_PSK authmode will be shown.
 - bit 7: determine whether AP with WPA2_WPA3_PSK authmode will be shown.
 - bit 8: determine whether AP with WAPI_PSK authmode will be shown.
 - bit 9: determine whether AP with OWE authmode will be shown.

Example

```
// The first parameter is 1, meaning that the result of the command AT+CWLAP will
↪be ordered according to RSSI;
// The second parameter is 31, namely 0x1F, meaning that the corresponding bits of
↪<print mask> are set to 1. All parameters will be shown in the result of
↪AT+CWLAP.
AT+CWLAPOPT=1,31
AT+CWLAP

// Just show the AP which authmode is OPEN
AT+CWLAPOPT=1,31,-100,1
AT+CWLAP
```

3.2.6 AT+CWLAP: List Available APs

Set Command

Function:

Query the APs with specified parameters, such as the SSID, MAC address, or channel.

Command:

```
AT+CWLAP=<ssid>,<mac>,<channel>,<scan_type>,<scan_time_min>,<scan_time_max>]
```

Execute Command

Function:

List all available APs.

Command:

```
AT+CWLAP
```

Response:

```
+CWLAP:<ecn>,<ssid>,<rssi>,<mac>,<channel>,<freq_offset>,<freqcal_val>,<pairwise_
↵cipher>,<group_cipher>,<bgn>,<wps>
OK
```

Parameters

- **<ecn>**: encryption method.
 - 0: OPEN
 - 1: WEP
 - 2: WPA_PSK
 - 3: WPA2_PSK
 - 4: WPA_WPA2_PSK
 - 5: WPA2_ENTERPRISE
 - 6: WPA3_PSK
 - 7: WPA2_WPA3_PSK
 - 8: WAPI_PSK
 - 9: OWE
- **<ssid>**: string parameter showing SSID of the AP.
- **<rssi>**: signal strength.
- **<mac>**: string parameter showing MAC address of the AP.
- **<channel>**: channel.
- **<scan_type>**: Wi-Fi scan type. Default: 0.
 - 0: active scan
 - 1: passive scan
- **<scan_time_min>**: the minimum active scan time per channel. Unit: millisecond. Range [0,1500]. If the scan type is passive, this parameter is invalid.
- **<scan_time_max>**: the maximum active scan time per channel. Unit: millisecond. Range [0,1500]. If this parameter is 0, the firmware will use the default time: 120 ms for active scan; 360 ms for passive scan.
- **<freq_offset>**: frequency offset (reserved item).
- **<freqcal_val>**: frequency calibration value (reserved item).
- **<pairwise_cipher>**: pairwise cipher type.
 - 0: None
 - 1: WEP40
 - 2: WEP104
 - 3: TKIP
 - 4: CCMP
 - 5: TKIP and CCMP
 - 6: AES-CMAC-128
 - 7: Unknown
- **<group_cipher>**: group cipher type, same enumerated value to <pairwise_cipher>.
- **<bgn>**: 802.11 b/g/n. If the corresponding bit is 1, the corresponding mode is enabled; if the corresponding bit is 0, the corresponding mode is disabled.
 - bit 0: bit to identify if 802.11b mode is enabled or not
 - bit 1: bit to identify if 802.11g mode is enabled or not
 - bit 2: bit to identify if 802.11n mode is enabled or not
- **<wps>**: wps flag.
 - 0: WPS disabled
 - 1: WPS enabled

Example

```
AT+CWLAP="Wi-Fi","ca:d7:19:d8:a6:44",6,0,400,1000

// Search for APs with a designated SSID:
AT+CWLAP="Wi-Fi"
```

3.2.7 AT+CWQAP: Disconnect from an AP

Execute Command

Command:

AT+CWQAP

Response:

OK

3.2.8 AT+CWSAP: Query/Set the configuration of an ESP32-C2 SoftAP

Query Command

Function:

Query the configuration parameters of an ESP32-C2 SoftAP.

Command:

AT+CWSAP?

Response:

+CWSAP:<ssid>,<pwd>,<channel>,<ecn>,<max conn>,<ssid hidden>
OK

Set Command

Function:

Set the configuration of an ESP32-C2 SoftAP.

Command:

AT+CWSAP=<ssid>,<pwd>,<chl>,<ecn>[,<max conn>][,<ssid hidden>]

Response:

OK

Parameters

- **<ssid>**: string parameter showing SSID of the AP.
- **<pwd>**: string parameter showing the password. Length: 8 ~ 63 bytes ASCII.
- **<channel>**: channel ID.
- **<ecn>**: encryption method; WEP is not supported.
 - 0: OPEN
 - 2: WPA_PSK
 - 3: WPA2_PSK
 - 4: WPA_WPA2_PSK
- **[<max conn>]**: maximum number of stations that ESP32-C2 SoftAP can connect. Range: [1,10].
- **[<ssid hidden>]**:
 - 0: broadcasting SSID (default).
 - 1: not broadcasting SSID.

Notes

- This command works only when *AT+CWMODE=2* or *AT+CWMODE=3*.
- The configuration changes will be saved in the NVS area if *AT+SYSTORE=1*.
- The default SSID varies from devices to device as it consists of the MAC address of the device. You can use *AT+CWSAP?* to query the default SSID.

Example

```
AT+CWSAP="ESP", "1234567890", 5, 3
```

3.2.9 AT+CWLIF: Obtain IP Address of the Station That Connects to an ESP32-C2 SoftAP

Execute Command

Command:

```
AT+CWLIF
```

Response:

```
+CWLIF:<ip addr>,<mac>
```

```
OK
```

Parameters

- **<ip addr>**: IP address of the station that connects to the ESP32-C2 SoftAP.
- **<mac>**: MAC address of the station that connects to the ESP32-C2 SoftAP.

Note

- This command cannot get a static IP. It works only when DHCP of both the ESP32-C2 SoftAP and the connected station are enabled.

3.2.10 AT+CWQIF: Disconnect Stations from an ESP32-C2 SoftAP

Execute Command

Function:

Disconnect all stations that are connected to the ESP32-C2 SoftAP.

Command:

```
AT+CWQIF
```

Response:

```
OK
```

Set Command

Function:

Disconnect a specific station from the ESP32-C2 SoftAP.

Command:

```
AT+CWQIF=<mac>
```

Response:

```
OK
```

Parameter

- **<mac>**: MAC address of the station to disconnect.

3.2.11 AT+CWDHCP: Enable/Disable DHCP

Query Command

Command:

```
AT+CWDHCP?
```

Response:

```
+CWDHCP:<state>  
OK
```

Set Command

Function:

Enable/disable DHCP.

Command:

```
AT+CWDHCP=<operate>,<mode>
```

Response:

```
OK
```

Parameters

- **<operate>**:
 - 0: disable
 - 1: enable
- **<mode>**:
 - Bit0: Station DHCP
 - Bit1: SoftAP DHCP
- **<state>**: the status of DHCP
 - Bit0:
 - * 0: Station DHCP is disabled.
 - * 1: Station DHCP is enabled.

- Bit1:
 - * 0: SoftAP DHCP is disabled.
 - * 1: SoftAP DHCP is enabled.
- Bit2:
 - * 0: Ethernet DHCP is disabled.
 - * 1: Ethernet DHCP is enabled.

Notes

- The configuration changes will be saved in the NVS area if *AT+SYSTORE=1*.
- This Set Command correlates with the commands that set static IP, such as *AT+CIPSTA* and *AT+CIPAP*:
 - If DHCP is enabled, static IPv4 address will be disabled;
 - If static IPv4 address is enabled, DHCP will be disabled;
 - The last configuration overwrites the previous configuration.

Example

```
// Enable Station DHCP. If the last DHCP mode is 2, the current DHCP mode will be
↪ 3.
AT+CWDHCP=1,1

// Disable SoftAP DHCP. If the last DHCP mode is 3, the current DHCP mode will be
↪ 1.
AT+CWDHCP=0,2
```

3.2.12 AT+CWDHCPS: Query/Set the IPv4 Addresses Allocated by an ESP32-C2 SoftAP DHCP Server

Query Command

Command:

```
AT+CWDHCPS?
```

Response:

```
+CWDHCPS=<lease time>,<start IP>,<end IP>
OK
```

Set Command

Function:

Set the IPv4 address range of the ESP32-C2 SoftAP DHCP server.

Command:

```
AT+CWDHCPS=<enable>,<lease time>,<start IP>,<end IP>
```

Response:

```
OK
```

Parameters

- **<enable>**:
 - 1: Enable DHCP server settings. The parameters below have to be set.
 - 0: Disable DHCP server settings and use the default IPv4 address range.
- **<lease time>**: lease time. Unit: minute. Range [1,2880].
- **<start IP>**: start IPv4 address of the IPv4 address range that can be obtained from ESP32-C2 SoftAP DHCP server.
- **<end IP>**: end IPv4 address of the IPv4 address range that can be obtained from ESP32-C2 SoftAP DHCP server.

Notes

- The configuration changes will be saved in the NVS area if [AT+SYSTORE=1](#).
- This AT command works only when both SoftAP and DHCP server are enabled for ESP32-C2.
- The IPv4 address should be in the same network segment as the IPv4 address of ESP32-C2 SoftAP.

Example

```
AT+CWDHCP=1,3,"192.168.4.10","192.168.4.15"
```

```
AT+CWDHCP=0 // Disable the settings and use the default IPv4 address range.
```

3.2.13 AT+CWAUTOCONN: Automatically Connect to an AP When Powered on

Set Command

Command:

```
AT+CWAUTOCONN=<enable>
```

Response:

```
OK
```

Parameters

- **<enable>**:
 - 1: Enable automatic connection to an AP when powered on. (Default)
 - 0: Disable automatic connection to an AP when powered on.

Note

- The configuration changes will be saved in the NVS area.

Example

```
AT+CWAUTOCONN=1
```

3.2.14 AT+CWAPPROTO: Query/Set the 802.11 b/g/n Protocol Standard of SoftAP Mode

Query Command

Command:

```
AT+CWAPPROTO?
```

Response:

```
+CWAPPROTO=<protocol>
OK
```

Set Command

Command:

```
AT+CWAPPROTO=<protocol>
```

Response:

```
OK
```

Parameters

- **<protocol>:**
 - bit0: 802.11b protocol standard.
 - bit1: 802.11g protocol standard.
 - bit2: 802.11n protocol standard.

Note

- See [Wi-Fi Protocol Mode](#) for the PHY mode supported by the ESP32-C2 device.
- By default, PHY mode of ESP32-C2 is 802.11bgn mode.

3.2.15 AT+CWSTAPROTO: Query/Set the 802.11 b/g/n Protocol Standard of Station Mode

Query Command

Command:

```
AT+CWSTAPROTO?
```

Response:

```
+CWSTAPROTO=<protocol>
OK
```

Set Command

Command:

```
AT+CWSTAPROTO=<protocol>
```

Response:

```
OK
```

Parameters

- **<protocol>:**
 - bit0: 802.11b protocol standard.
 - bit1: 802.11g protocol standard.
 - bit2: 802.11n protocol standard.

Note

- See [Wi-Fi Protocol Mode](#) for the PHY mode supported by the ESP32-C2 device.
- By default, PHY mode of ESP32-C2 is 802.11bgn mode.

3.2.16 AT+CIPSTAMAC: Query/Set the MAC Address of an ESP32-C2 Station

Query Command**Function:**

Query the MAC address of the ESP32-C2 Station.

Command:

```
AT+CIPSTAMAC?
```

Response:

```
+CIPSTAMAC:<mac>  
OK
```

Set Command**Function:**

Set the MAC address of an ESP32-C2 station.

Command:

```
AT+CIPSTAMAC=<mac>
```

Response:

```
OK
```

Parameters

- **<mac>:** string parameter showing MAC address of an ESP32-C2 station.

Notes

- The configuration changes will be saved in the NVS area if *AT+SYSTORE=1*.
- The MAC address of ESP32-C2 Station is different from that of the ESP32-C2 SoftAP. Please make sure that you do not set the same MAC address for both of them.
- Bit 0 of the ESP32-C2 MAC address CANNOT be 1. For example, a MAC address can be “1a:…” but not “15:…”.
- FF:FF:FF:FF:FF:FF and 00:00:00:00:00:00 are invalid MAC address and cannot be set.

Example

```
AT+CIPSTAMAC="1a:fe:35:98:d3:7b"
```

3.2.17 AT+CIPAPMAC: Query/Set the MAC Address of an ESP32-C2 SoftAP

Query Command

Function:

Query the MAC address of the ESP32-C2 SoftAP.

Command:

```
AT+CIPAPMAC?
```

Response:

```
+CIPAPMAC:<mac>
OK
```

Set Command

Function:

Set the MAC address of the ESP32-C2 SoftAP.

Command:

```
AT+CIPAPMAC=<mac>
```

Response:

```
OK
```

Parameters

- **<mac>**: string parameter showing MAC address of the ESP32-C2 SoftAP.

Notes

- The configuration changes will be saved in the NVS area if *AT+SYSTORE=1*.
- Bit 0 of the ESP32-C2 MAC address CANNOT be 1. For example, a MAC address can be “18:…” but not “15:…”.

- FF:FF:FF:FF:FF:FF and 00:00:00:00:00:00 are invalid MAC and cannot be set.

Example

```
AT+CIPAPMAC="18:fe:35:98:d3:7b"
```

3.2.18 AT+CIPSTA: Query/Set the IP Address of an ESP32-C2 Station

Query Command

Function:

Query the IP address of the ESP32-C2 Station.

Command:

```
AT+CIPSTA?
```

Response:

```
+CIPSTA:ip:<"ip">
+CIPSTA:gateway:<"gateway">
+CIPSTA:netmask:<"netmask">
+CIPSTA:ip6ll:<"ipv6 addr">
+CIPSTA:ip6gl:<"ipv6 addr">
```

```
OK
```

Set Command

Function:

Set the IPv4 address of the ESP32-C2 station.

Command:

```
AT+CIPSTA=<"ip">[,<"gateway">,<"netmask">]
```

Response:

```
OK
```

Parameters

- <"ip">: string parameter showing the IPv4 address of the ESP32-C2 station.
- <"gateway">: gateway.
- <"netmask">: netmask.
- <"ipv6 addr">: string parameter showing the IPv6 address of the ESP32-C2 station.

Notes

- For the query command, only when the ESP32-C2 station is connected to an AP or the static IP address is configured can its IP address be queried.
- The configuration changes will be saved in the NVS area if [AT+SYSTORE=1](#).
- The Set Command correlates with the commands that set DHCP, such as [AT+CWDHCP](#).
 - If static IPv4 address is enabled, DHCP will be disabled;

- If DHCP is enabled, static IPv4 address will be disabled;
- The last configuration overwrites the previous configuration.

Example

```
AT+CIPSTA="192.168.6.100","192.168.6.1","255.255.255.0"
```

3.2.19 AT+CIPAP: Query/Set the IP Address of an ESP32-C2 SoftAP

Query Command

Function:

Query the IP address of the ESP32-C2 SoftAP.

Command:

```
AT+CIPAP?
```

Response:

```
+CIPAP:ip:<"ip">
+CIPAP:gateway:<"gateway">
+CIPAP:netmask:<"netmask">
+CIPAP:ip6ll:<"ipv6 addr">

OK
```

Set Command

Function:

Set the IPv4 address of the ESP32-C2 SoftAP.

Command:

```
AT+CIPAP=<"ip">[,<"gateway">,<"netmask">]
```

Response:

```
OK
```

Parameters

- <"ip">: string parameter showing the IPv4 address of the ESP32-C2 SoftAP.
- <"gateway">: gateway.
- <"netmask">: netmask.
- <"ipv6 addr">: string parameter showing the IPv6 address of the ESP32-C2 SoftAP.

Notes

- The set command is just applied to the IPv4 network, but not the IPv6 network.
- The configuration changes will be saved in the NVS area if [AT+SYSTORE=1](#).
- The set command correlates with the commands that set DHCP, such as [AT+CWDHCP](#).
 - If static IPv4 address is enabled, DHCP will be disabled;
 - If DHCP is enabled, static IPv4 address will be disabled;

- The last configuration overwrites the previous configuration.

Example

```
AT+CIPAP="192.168.5.1","192.168.5.1","255.255.255.0"
```

3.2.20 AT+CWSTARTSMART: Start SmartConfig

Execute Command

Function:

Start SmartConfig of the type ESP-TOUCH+AirKiss.

Command:

```
AT+CWSTARTSMART
```

Set Command

Function:

Start SmartConfig of a designated type.

Command:

```
AT+CWSTARTSMART=<type>[,<auth floor>][,<"esptouch v2 key">]
```

Response:

```
OK
```

Parameters

- **<type>**:
 - 1: ESP-TOUCH
 - 2: AirKiss
 - 3: ESP-TOUCH+AirKiss
 - 4: ESP-TOUCH v2
- **<auth floor>**: Wi-Fi authentication mode floor. ESP-AT will not connect to the AP whose authmode is lower than this floor.
 - 0: OPEN (Default)
 - 1: WEP
 - 2: WPA_PSK
 - 3: WPA2_PSK
 - 4: WPA_WPA2_PSK
 - 5: WPA2_ENTERPRISE
 - 6: WPA3_PSK
 - 7: WPA2_WPA3_PSK
- **<" esptouch v2 key" >**: ESP-TOUCH v2 decrypt key. It is used to decrypt Wi-Fi password and reserved data. Length: 16 bytes.

Notes

- For more details on SmartConfig, please see [ESP-TOUCH User Guide](#).
- SmartConfig is only available in the ESP32-C2 station mode.
- The message `Smart get Wi-Fi info` means that SmartConfig has successfully acquired the AP information. ESP32-C2 will try to connect to the target AP.
- Message `+SCRD:<length>,<rvd data>` means that ESP-Touch v2 has successfully acquired the reserved data information.
- Message `Smartconfig connected Wi-Fi` is printed if the connection is successful.
- When AT returns `Smartconfig connected Wi-Fi`, it is recommended to delay more than 6 seconds before executing `AT+CWSTOPSMART` because the ESP32-C2 needs to synchronize the SmartConfig results to the mobile phone.
- Use command `AT+CWSTOPSMART` to stop SmartConfig before running other commands. Please make sure that you do not execute other commands during SmartConfig.

Example

```
AT+CWMODE=1
AT+CWSTARTSMART
```

3.2.21 AT+CWSTOPSMART: Stop SmartConfig

Execute Command

Command:

```
AT+CWSTOPSMART
```

Response:

```
OK
```

Note

- Irrespective of whether SmartConfig succeeds or not, please always call `AT+CWSTOPSMART` before executing any other AT commands to release the internal memory taken up by SmartConfig.

Example

```
AT+CWMODE=1
AT+CWSTARTSMART
AT+CWSTOPSMART
```

3.2.22 AT+WPS: Enable the WPS Function

Set Command

Command:

```
AT+WPS=<enable>[,<auth floor>]
```

Response:

OK

Parameters

- **<enable>**:
 - 1: Enable WPS (Wi-Fi Protected Setup) that uses PBC (Push Button Configuration) mode.
 - 0: Disable WPS that uses PBC mode.
- **<auth floor>**: Wi-Fi authentication mode floor. ESP-AT will not connect to the AP whose authmode is lower than this floor.
 - 0: OPEN (Default)
 - 1: WEP
 - 2: WPA_PSK
 - 3: WPA2_PSK
 - 4: WPA_WPA2_PSK
 - 5: WPA2_ENTERPRISE
 - 6: WPA3_PSK
 - 7: WPA2_WPA3_PSK

Notes

- WPS can only be used when the ESP32-C2 station is enabled.
- WPS does not support WEP (Wired-Equivalent Privacy) encryption.

Example

AT+CWMODE=1
AT+WPS=1

3.2.23 AT+MDNS: Configure the mDNS Function

Set Command

Command:

AT+MDNS=<enable>[, <hostname>, <service_name>, <port>]

Response:

OK

Parameters

- **<enable>**:
 - 1: Enable the mDNS function. The following three parameters need to be set.
 - 0: Disable the mDNS function. The following three parameters does not need to be set.
- **<hostname>**: mDNS host name.
- **<service_name>**: mDNS service name.
- **<port>**: mDNS port.

Example

```
AT+CWMODE=1
AT+CWJAP="1234567890","1234567890"
AT+MDNS=1,"espressif","_iot",8080
AT+MDNS=0
```

3.2.24 AT+CWJEAP: Connect to a WPA2 Enterprise AP

Query Command

Function:

Query the configuration information of the Enterprise AP to which the ESP32-C2 station is already connected.

Command:

```
AT+CWJEAP?
```

Response:

```
+CWJEAP:<ssid>,<method>,<identity>,<username>,<password>,<security>
OK
```

Set Command

Function:

Connect to the targeted Enterprise AP.

Command:

```
AT+CWJEAP=<ssid>,<method>,<identity>,<username>,<password>,<security>[,<jeap_
↪timeout>]
```

Response:

```
OK
```

or

```
+CWJEAP:Timeout
ERROR
```

Parameters

- **<ssid>**: the SSID of the Enterprise AP.
 - Escape character syntax is needed if SSID or password contains any special characters, such as , , " , or \ \ .
- **<method>**: WPA2 Enterprise authentication method.
 - 0: EAP-TLS.
 - 1: EAP-PEAP.
 - 2: EAP-TTLS.
- **<identity>**: identity for phase 1. String limited to 1 ~ 32.
- **<username>**: username for phase 2. Range: 1 ~ 32 bytes. For the EAP-PEAP and EAP-TTLS method, you must set this parameter. For the EAP-TLS method, you don't need to.
- **<password>**: password for phase 2. Range: 1 ~ 32 bytes. For the EAP-PEAP and EAP-TTLS method, you must set this parameter. For the EAP-TLS method, you don't need to.

- **<security>**:
 - Bit0: Client certificate.
 - Bit1: Server certificate.
- **[<jeap_timeout>]**: maximum timeout for *AT+CWJEAP* command. Unit: second. Default: 15. Range: [3,600].

Example

```
// Connect to EAP-TLS mode Enterprise AP, set identity, verify server certificate,
↪and load client certificate
AT+CWJEAP="dlink11111",0,"example@espressif.com",,,3

// Connect to EAP-PEAP mode Enterprise AP, set identity, username and password,
↪not verify server certificate and not load client certificate
AT+CWJEAP="dlink11111",1,"example@espressif.com","espressif","test11",0
```

Error Code:

The WPA2 Enterprise error code will be prompt as ERR CODE:0x<%08x>.

AT_EAP_MALLOC_FAILED	0x8001
AT_EAP_GET_NVS_CONFIG_FAILED	0x8002

AT_EAP_METHOD_ERROR	0x8024

Note

- The configuration changes will be saved in the NVS area if *AT+SYSSTORE=1*.
- This command requires Station mode to be active.
- TLS mode will use client certificate. Please make sure it is enabled.

3.2.25 AT+CWHOSTNAME: Query/Set the Host Name of an ESP32-C2 Station**Query Command****Function:**

Query the host name of ESP32-C2 Station.

Command:

```
AT+CWHOSTNAME?
```

Response:

```
+CWHOSTNAME:<hostname>
```

```
OK
```

Set Command**Function:**

Set the host name of ESP32-C2 Station.

Command:

```
AT+CWHOSTNAME=<hostname>
```

Response:

```
OK
```

If the Station mode is not enabled, the command will return:

```
ERROR
```

Parameters

- **<hostname>**: the host name of the ESP32-C2 Station. Maximum length: 32 bytes.

Note

- The configuration changes are not saved in the flash.

Example

```
AT+CWMODE=3
AT+CWHOSTNAME="my_test"
```

3.2.26 AT+CWCOUNTRY: Query/Set the Wi-Fi Country Code

Query Command

Function:

Query Wi-Fi country code information.

Command:

```
AT+CWCOUNTRY?
```

Response:

```
+CWCOUNTRY:<country_policy>,<country_code>,<start_channel>,<total_channel_count>
```

```
OK
```

Set Command

Function:

Set the Wi-Fi country code information.

Command:

```
AT+ CWCOUNTRY=<country_policy>,<country_code>,<start_channel>,<total_channel_count>
```

Response:

```
OK
```

Parameters

- **<country_policy>**:
 - 0: will change the county code to be the same as the AP that the ESP32-C2 is connected to.
 - 1: the country code will not change, always be the one set by command.
- **<country_code>**: country code. Maximum length: 3 characters. Refer to [ISO 3166-1 alpha-2](#) for country codes.
- **<start_channel>**: the channel number to start. Range: [1,14].
- **<total_channel_count>**: total number of channels.

Note

- See [Wi-Fi Country Code](#) for more details.
- The configuration changes are not saved in the flash.

Example

```
AT+CWMODE=3
AT+CWCOUNTRY=1, "CN", 1, 13
```

3.3 TCP/IP AT Commands

- **AT+CIPV6**: Enable/disable the network of Internet Protocol Version 6 (IPv6).
- **AT+CIPSTATE**: Obtain the TCP/UDP/SSL connection information.
- **AT+CIPSTATUS** (*deprecated*): Obtain the TCP/UDP/SSL connection status and information.
- **AT+CIPDOMAIN**: Resolve a Domain Name.
- **AT+CIPSTART**: Establish TCP connection, UDP transmission, or SSL connection.
- **AT+CIPSTARTEX**: Establish TCP connection, UDP transmission, or SSL connection with an automatically assigned ID.
- **[Data Mode Only] +++**: Exit from the *data mode*.
- **AT+CIPSEND**: Send data in the *normal transmission mode* or Wi-Fi *normal transmission mode*.
- **AT+CIPSENDL**: Send long data in parallel in the *normal transmission mode*.
- **AT+CIPSENDCFG**: Set the configuration for the command **AT+CIPSENDL**.
- **AT+CIPSENDEX**: Send data in the *normal transmission mode* in expanded ways.
- **AT+CIPCLOSE**: Close TCP/UDP/SSL connection.
- **AT+CIFSR**: Obtain the local IP address and MAC address.
- **AT+CIPMUX**: Enable/disable the multiple connections mode.
- **AT+CIPSERVER**: Delete/create a TCP/SSL server.
- **AT+CIPSERVERMAXCONN**: Query/Set the maximum connections allowed by a server.
- **AT+CIPMODE**: Query/Set the transmission mode.
- **AT+SAVETRANSLINK**: Set whether to enter Wi-Fi *normal transmission mode* on power-up.
- **AT+CIPSTO**: Query/Set the local TCP Server Timeout.
- **AT+CIPSNTPCFG**: Query/Set the time zone and SNTP server.
- **AT+CIPSNTPTIME**: Query the SNTP time.
- **AT+CIPSNTPTINTV**: Query/Set the SNTP time synchronization interval.
- **AT+CIPFWVER**: Query the existing AT firmware version on the server.
- **AT+CIUPDATE**: Upgrade the firmware through Wi-Fi.
- **AT+CIPDINFO**: Set “+IPD” message mode.
- **AT+CIPSSLCCONF**: Query/Set SSL clients.
- **AT+CIPSSLCCN**: Query/Set the Common Name of the SSL client.
- **AT+CIPSSLCSNI**: Query/Set SSL client Server Name Indication (SNI).
- **AT+CIPSSLCALPN**: Query/Set SSL client Application Layer Protocol Negotiation (ALPN).
- **AT+CIPSSLCPK**: Query/Set SSL client Pre-shared Key (PSK).
- **AT+CIPRECONNINTV**: Query/Set the TCP/UDP/SSL reconnection interval for the Wi-Fi *normal transmission mode*.
- **AT+CIPRECVMODE**: Query/Set socket receiving mode.
- **AT+CIPRECVDATA**: Obtain socket data in passive receiving mode.
- **AT+CIPRECLEN**: Obtain socket data length in passive receiving mode.
- **AT+PING**: Ping the remote host.
- **AT+CIPDNS**: Query/Set DNS server information.
- **AT+CIPTCPOPT**: Query/Set the socket options.

3.3.1 AT+CIPV6: Enable/disable the network of Internet Protocol Version 6 (IPv6)

Query Command

Function:

Query whether IPv6 is enabled.

Command:

```
AT+CIPV6?
```

Response:

```
+CIPV6:<enable>
```

```
OK
```

Set Command

Function:

Enable/Disable IPv6 network.

Command:

```
AT+CIPV6=<enable>
```

Response:

```
OK
```

Parameters

- **<enable>**: status of IPv6 network. Default: 0.
 - 0: disable IPv6 network.
 - 1: enable IPv6 network.

Notes

- You should enable IPv6 network before using IPv6 related upper layer AT commands (TCP/UDP/SSL/PING/DNS based on IPv6 network, also known as TCP6/UDP6/SSL6/PING6/DNS6 or TCPv6/UDPv6/SSLv6/PINGv6/DNSv6).

3.3.2 AT+CIPSTATE: Obtain the TCP/UDP/SSL Connection Information

Query Command

Command:

```
AT+CIPSTATE?
```

Response:

When there is a connection, AT returns:

```
+CIPSTATE:<link ID>,<"type">,<"remote IP">,<remote port>,<local port>,<tetype>
```

```
OK
```

When there is no connection, AT returns:

```
OK
```

Parameters

- **<link ID>**: ID of the connection (0~4), used for multiple connections.
- **<" type" >**: string parameter showing the type of transmission: "TCP" , "TCPv6" , "UDP" , "UDPv6" , "SSL" , or "SSLv6" .

- **<" remote IP" >**: string parameter showing the remote IPv4 address or IPv6 address.
- **<remote port>**: the remote port number.
- **<local port>**: the local port number.
- **<tetype>**:
 - 0: ESP32-C2 runs as a client.
 - 1: ESP32-C2 runs as a server.

3.3.3 AT+CIPSTATUS (deprecated): Obtain the TCP/UDP/SSL Connection Status and Information

Execute Command

Command:

```
AT+CIPSTATUS
```

Response:

```
STATUS:<stat>
+CIPSTATUS:<link ID>,<"type">,<"remote IP">,<remote port>,<local port>,<tetype>
OK
```

Parameters

- **<stat>**: status of the ESP32-C2 station interface.
 - 0: The ESP32-C2 station is not initialized.
 - 1: The ESP32-C2 station is initialized, but not started a Wi-Fi connection yet.
 - 2: The ESP32-C2 station is connected to an AP and its IP address is obtained.
 - 3: The ESP32-C2 station has created a TCP/SSL transmission.
 - 4: All of the TCP/UDP/SSL connections of the ESP32-C2 station are disconnected.
 - 5: The ESP32-C2 station started a Wi-Fi connection, but was not connected to an AP or disconnected from an AP.
- **<link ID>**: ID of the connection (0~4), used for multiple connections.
- **<" type" >**: string parameter showing the type of transmission: "TCP" , "TCPv6" , "UDP" , "UDPv6" , "SSL" , or "SSLv6" .
- **<" remote IP" >**: string parameter showing the remote IPv4 address or IPv6 address.
- **<remote port>**: the remote port number.
- **<local port>**: the local port number.
- **<tetype>**:
 - 0: ESP32-C2 runs as a client.
 - 1: ESP32-C2 runs as a server.

Notes

- It is recommended to use [AT+CWSTATE](#) command to query Wi-Fi state and [AT+CIPSTATE](#) command to query TCP/UDP/SSL state.

3.3.4 AT+CIPDOMAIN: Resolve a Domain Name

Set Command

Command:

```
AT+CIPDOMAIN=<"domain name">[,<ip network>]
```

Response:

```
+CIPDOMAIN:<"IP address">
```

```
OK
```

Parameter

- <" domain name" >: the domain name.
- <ip network>: preferred IP network. Default: 1.
 - 1: preferred resolution of IPv4 address
 - 2: resolve IPv4 address only
 - 3: resolve IPv6 address only
- <" IP address" >: the resolved IPv4 address or IPv6 address.

Example

```
AT+CWMODE=1 // set the station mode
AT+CWJAP="SSID","password" // access to the internet
AT+CIPDOMAIN="iot.espressif.cn" // Domain Name Resolution function

// Domain Name Resolution Function for IPv4 address only
AT+CIPDOMAIN="iot.espressif.cn",2

// Domain Name Resolution Function for IPv6 address only
AT+CIPDOMAIN="ipv6.test-ipv6.com",3

// Domain Name Resolution Function for compatible IP address
AT+CIPDOMAIN="ds.test-ipv6.com",1
```

3.3.5 AT+CIPSTART: Establish TCP Connection, UDP Transmission, or SSL Connection

Establish TCP Connection

Set Command Command:

```
// Single connection (AT+CIPMUX=0):
AT+CIPSTART=<"type">,<"remote host">,<remote port>[,<keep_alive>][,<"local IP">]

// Multiple Connections (AT+CIPMUX=1):
AT+CIPSTART=<link ID>,<"type">,<"remote host">,<remote port>[,<keep_alive>][,<
↪ "local IP">]
```

Response:

For single connection, it returns:

```
CONNECT
```

```
OK
```

For multiple connections, it returns:

```
<link ID>,CONNECT
```

```
OK
```

Parameters

- **<link ID>**: ID of network connection (0~4), used for multiple connections. The range of this parameter depends on two configuration items in `menuconfig`. One is `AT_SOCKET_MAX_CONN_NUM` of the AT component, and its default value is 5. The other is `LWIP_MAX_SOCKETS` of the LWIP component, and its default value is 10. To modify the range of this parameter, you need to set `AT_SOCKET_MAX_CONN_NUM` and make sure it is no larger than the value of `LWIP_MAX_SOCKETS`. (See [Compile ESP-AT Project](#) for details on configuring and build ESP-AT projects.)
- **<" type">**: string parameter showing the type of transmission: "TCP", or "TCPv6". Default: "TCP".
- **<" remote host">**: IPv4 address, IPv6 address, or domain name of remote host.
- **<remote port>**: the remote port number.
- **<keep_alive>**: It configures the [SO_KEEPALIVE](#) option for socket. Unit: second.
 - Range: [0,7200].
 - * 0: disable keep-alive function (default).
 - * 1 ~ 7200: enable keep-alive function. [TCP_KEEPIPLE](#) value is **<keep_alive>**, [TCP_KEEPINTVL](#) value is 1, and [TCP_KEEPCNT](#) value is 3.
 - This parameter of this command is the same as the **<keep_alive>** parameter of [AT+CIPTCPOPT](#) command. It always takes the value set later by either of the two commands. If it is omitted or not set, the last configured value is used by default.
- **<" local IP">**: the local IPv4 address or IPv6 address that the connection binds. This parameter is useful when you are using multiple network interfaces or multiple IP addresses. By default, it is disabled. If you want to use it, you should specify it first. Null is also valid.

Notes

- If you want to establish TCP connection based on IPv6 network, set [AT+CIPV6=1](#) first, and ensure the connected AP by [AT+CWJAP](#) supports IPv6 and esp-at got the IPv6 address which you can check it by [AT+CIPSTA](#).

Example

```
AT+CIPSTART="TCP","iot.espressif.cn",8000
AT+CIPSTART="TCP","192.168.101.110",1000
AT+CIPSTART="TCP","192.168.101.110",2500,60
AT+CIPSTART="TCP","192.168.101.110",1000,, "192.168.101.100"
AT+CIPSTART="TCPv6","test-ipv6.com",80
AT+CIPSTART="TCPv6","fe80::860d:8eff:fe9d:cd90",1000,, "fe80::411c:1fdb:22a6:4d24"

// esp-at has obtained an IPv6 global address by AT+CWJAP before
AT+CIPSTART="TCPv6","2404:6800:4005:80b::2004",80,,
↪ "240e:3a1:2070:11c0:32ae:a4ff:fe80:65ac"
```

Establish UDP Transmission

Set Command Command:

```
// Single connection (AT+CIPMUX=0):
AT+CIPSTART=<"type">,<"remote host">,<remote port>[,<local port>,<mode>,<"local IP
↪ ">]

// Multiple connections (AT+CIPMUX=1):
AT+CIPSTART=<link ID>,<"type">,<"remote host">,<remote port>[,<local port>,<mode>,<
↪ "local IP">]
```

Response:

For single connection, it returns:

```
CONNECT
```

```
OK
```

For multiple connections, it returns:

```
<link ID>,CONNECT
```

```
OK
```

Parameters

- **<link ID>**: ID of network connection (0~4), used for multiple connections.
- **<" type" >**: string parameter showing the type of transmission: "UDP", or "UDPv6". Default: "TCP".
- **<" remote host" >**: IPv4 address, IPv6 address, or domain name of remote host.
- **<remote port>**: remote port number.
- **<local port>**: UDP port of ESP32-C2.
- **<mode>**: In the UDP Wi-Fi passthrough, the value of this parameter has to be 0.
 - 0: After UDP data is received, the parameters **<"remote host">** and **<remote port>** will stay unchanged (default).
 - 1: Only the first time that UDP data is received from an IP address and port that are different from the initially set value of parameters **<remote host>** and **<remote port>**, will they be changed to the IP address and port of the device that sends the data.
 - 2: Each time UDP data is received, the **<"remote host">** and **<remote port>** will be changed to the IP address and port of the device that sends the data.
- **<" local IP" >**: the local IPv4 address or IPv6 address that the connection binds. This parameter is useful when you are using multiple network interfaces or multiple IP addresses. By default, it is disabled. If you want to use it, you should specify it first. Null is also valid.

Notes

- If the remote host over the UDP is an IPv4 multicast address (224.0.0.0 ~ 239.255.255.255), the ESP32-C2 will send and receive the UDPv4 multicast.
- If the remote host over the UDP is an IPv4 broadcast address (255.255.255.255), the ESP32-C2 will send and receive the UDPv4 broadcast.
- If the remote host over the UDP is an IPv6 multicast address (FF00:0:0:0:0:0:0 ~ FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF), the ESP32-C2 will send and receive the UDP multicast based on IPv6 network.
- To use the parameter **<mode>**, parameter **<local port>** must be set first.
- If you want to establish UDP connection based on IPv6 network, set [AT+CIPV6=1](#) first, and ensure the connected AP by [AT+CWJAP](#) supports IPv6 and esp-at got the IPv6 address which you can check it by AT+CIPSTA.
- If you want to receive a UDP packet longer than 1460 bytes, please compile the firmware on your own by following [Compile ESP-AT Project](#) and choosing the following configurations in the Step 5. Configure: Component config->LWIP->Enable reassembly incoming fragmented IP4 packets.

Example

```
// UDP unicast
AT+CIPSTART="UDP", "192.168.101.110", 1000, 1002, 2
AT+CIPSTART="UDP", "192.168.101.110", 1000, , , "192.168.101.100"

// UDP unicast based on IPv6 network
AT+CIPSTART="UDPv6", "fe80::32ae:a4ff:fe80:65ac", 1000, , , "fe80::5512:f37f:bb03:5d9b"

// UDP multicast based on IPv6 network
AT+CIPSTART="UDPv6", "FF02::FC", 1000, 1002, 0
```

Establish SSL Connection

Set Command Command:

```
// Single connection (AT+CIPMUX=0):
AT+CIPSTART=<"type">,<"remote host">,<remote port>[,<keep_alive>,<"local IP">]

// Multiple connections (AT+CIPMUX=1):
AT+CIPSTART=<link ID>,<"type">,<"remote host">,<remote port>[,<keep_alive>,<"local IP">]
```

Response:

For single connection, it returns:

```
CONNECT
OK
```

For multiple connections, it returns:

```
<link ID>,CONNECT
OK
```

Parameters

- **<link ID>**: ID of network connection (0~4), used for multiple connections.
- **<" type" >**: string parameter showing the type of transmission: "SSL", or "SSLv6". Default: "TCP".
- **<" remote host" >**: IPv4 address, IPv6 address, or domain name of remote host.
- **<remote port>**: the remote port number.
- **<keep_alive>**: It configures the [SO_KEEPALIVE](#) option for socket. Unit: second.
 - Range: [0,7200].
 - * 0: disable keep-alive function (default).
 - * 1 ~ 7200: enable keep-alive function. [TCP_KEEPIPLE](#) value is **<keep_alive>**, [TCP_KEEPIPLE](#) value is 1, and [TCP_KEEPCNT](#) value is 3.
 - This parameter of this command is the same as the **<keep_alive>** parameter of [AT+CIPTCPOPT](#) command. It always takes the value set later by either of the two commands. If it is omitted or not set, the last configured value is used by default.
- **<" local IP" >**: the local IPv4 address or IPv6 address that the connection binds. This parameter is useful when you are using multiple network interfaces or multiple IP addresses. By default, it is disabled. If you want to use it, you should specify it first. Null is also valid.

Notes

- The number of SSL connections depends on available memory and the maximum number of connections.
- SSL connection needs a large amount of memory. Insufficient memory may cause the system reboot.
- If the AT+CIPSTART is based on an SSL connection and the timeout of each packet is 10 s, the total timeout will be much longer depending on the number of handshake packets.
- If you want to establish SSL connection based on IPv6 network, set [AT+CIPV6=1](#) first, and ensure the connected AP by [AT+CWJAP](#) supports IPv6 and esp-at got the IPv6 address which you can check it by AT+CIPSTA.

Example

```
AT+CIPSTART="SSL","iot.espressif.cn",8443
AT+CIPSTART="SSL","192.168.101.110",1000,, "192.168.101.100"
```

(continues on next page)

(continued from previous page)

```
// esp-at has obtained an IPv6 global address by AT+CWJAP before
AT+CIPSTART="SSLv6", "240e:3a1:2070:11c0:6972:6f96:9147:d66d", 1000,,
↪ "240e:3a1:2070:11c0:55ce:4e19:9649:b75"
```

3.3.6 AT+CIPSTARTEX: Establish TCP connection, UDP transmission, or SSL connection with an Automatically Assigned ID

This command is similar to *AT+CIPSTART* except that you don't need to assign an ID by yourself in multiple connections mode (*AT+CIPMUX=1*). The system will assign an ID to the new connection automatically.

3.3.7 [Data Mode Only] +++: Exit from Data Mode

Special Execute Command

Function:

Exit from *Data Mode* and enter the *Command Mode*.

Command:

```
// Only for data mode
+++
```

Notes

- This special execution command consists of three identical + characters (0x2b ASCII), and no CR-LF appends to the command tail.
- Make sure there is more than 20 ms interval before the first + character, more than 20 ms interval after the third + character, less than 20 ms interval among the three + characters. Otherwise, the + characters will be sent out as normal data.
- This command returns no reply.
- Please wait for at least one second before sending the next AT command.

3.3.8 AT+CIPSEND: Send Data in the Normal Transmission Mode or Wi-Fi Passthrough Mode

Set Command

Function:

Set the data length to be send in the *Normal Transmission Mode*. If the length of data you need to send exceeds 8192 bytes, please use the *AT+CIPSENDL* command.

Command:

```
// Single connection: (AT+CIPMUX=0)
AT+CIPSEND=<length>

// Multiple connections: (AT+CIPMUX=1)
AT+CIPSEND=<link ID>,<length>

// Remote host and port can be set for UDP transmission:
AT+CIPSEND=[<link ID>,<length>[,<"remote host">,<remote port>]
```

Response:

OK

>

This response indicates that AT is ready for receiving serial data. You should enter the data, and when the data length reaches the `<length>` value, the transmission of data starts.

If the connection cannot be established or is disrupted during data transmission, the system returns:

ERROR

If data is transmitted successfully, the system returns:

SEND OK

Execute Command

Function:

Enter the Wi-Fi *Passthrough Mode*.

Command:

AT+CIPSEND

Response:

OK

>

or

ERROR

Enter the Wi-Fi *Passthrough Mode*. The ESP32-C2 can receive 8192 bytes and send 2920 bytes at most each time. If the length of the currently received data is greater than the maximum number of bytes that can be sent, AT will send the received data immediately; Otherwise, the received data will be sent out within 20 ms. When a single packet containing `+++` is received, the ESP32-C2 will exit the data sending mode under the Wi-Fi *Passthrough Mode*. Please wait for at least one second before sending the next AT command.

This command can only be used for single connection in the Wi-Fi *Passthrough Mode*. For UDP Wi-Fi passthrough, the `<mode>` parameter has to be 0 when using *AT+CIPSTART*.

Parameters

- **<link ID>**: ID of the connection (0~4), for multiple connections.
- **<length>**: data length. Maximum: 8192 bytes.
- **<" remote host" >**: IPv4 address, IPv6 address, or domain name of remote host. It can be set in UDP transmission.
- **<remote port>**: the remote port number.

Notes

- You can use *AT+CIPTCPOPT* command to configure socket options for each TCP connection. For example, setting `<so_sndtimeo>` to 5000 will enable TCP send to return results within 5 seconds, whether it succeeds or fails. This can save the time that the MCU waits for AT command response.

3.3.9 AT+CIPSENDL: Send Long Data in Parallel in the Normal Transmission Mode.

Set Command

Function:

In the *Normal Transmission Mode*, set the data length to be sent, and then send data to remote host in parallel (the AT command port receives data in parallel with the AT sending data to the remote host). You can use the *AT+CIPSENDLCFG* command to configure this command. If the length of data you need to send is less than 8192 bytes, you also can use the *AT+CIPSEND* command.

Command:

```
// Single connection: (AT+CIPMUX=0)
AT+CIPSENDL=<length>

// Multiple connections: (AT+CIPMUX=1)
AT+CIPSENDL=<link ID>,<length>

// Remote host and port can be set for UDP transmission:
AT+CIPSENDL=[<link ID>,<length>[,<"remote host">,<remote port>]
```

Response:

```
OK

>
```

This response indicates that AT enters the *Data Mode* and AT command port is ready to receive data. You can enter the data now. Once the port receives data, it will be pushed to underlying protocol stack and the transmission starts.

If the transmission starts, the system reports message according to *AT+CIPSENDLCFG* configuration:

```
+CIPSENDL:<had sent len>,<port recv len>
```

If the transmission is cancelled by *+++* command, the system returns:

```
SEND CANCELLED
```

If not all the data has been sent out, the system finally returns:

```
SEND FAIL
```

If all the data is transmitted successfully, the system finally returns:

```
SEND OK
```

When the connection is disconnected, you can send *+++* command to cancel the transmission, then the ESP32-C2 will exit from the *Data Mode*, otherwise, the *Data Mode* will not end until the AT command port receives all the data of the specified *<length>*.

Parameters

- **<link ID>**: ID of the connection (0~4), for multiple connections.
- **<length>**: data length. Maximum: $2^{31} - 1$ bytes.
- **<"remote host">**: IPv4 address, IPv6 address, or domain name of remote host. It can be set in UDP transmission.
- **<remote port>**: the remote port number.
- **<had sent len>**: the length of data successfully sent to the underlying protocol stack.
- **<port recv len>**: data length received by AT command port.

Notes

- You can use [AT+CIPTCPOPT](#) command to configure socket options for each TCP connection. For example, setting `<so_sndtimeo>` to 5000 will enable TCP send to return results within 5 seconds, whether it succeeds or fails. This can save the time that the MCU waits for AT command response.

3.3.10 AT+CIPSENDLCFG: Set the Configuration for the Command AT+CIPSENDL

Query Command

Function:

Query the configuration of [AT+CIPSENDL](#).

Command:

```
AT+CIPSENDLCFG?
```

Response:

```
+CIPSENDLCFG:<report size>,<transmit size>
```

```
OK
```

Set Command

Function:

Set the configuration of [AT+CIPSENDL](#).

Command:

```
AT+CIPSENDLCFG:<report size>[,<transmit size>]
```

Response:

```
OK
```

Parameters

- **<report size>**: report block size for [AT+CIPSENDL](#). Default: 1024. Range: [100,2²⁰]. For example, set `<report size>` to 100, `<had sent len>` report sequence in the response of [AT+CIPSENDL](#) will be (100, 200, 300, 400, ...). The final `<had sent len>` report is always equal to the data length that had been sent out.
- **<transmit size>**: transmit block size of [AT+CIPSENDL](#). It specifies the size of the data block sent to the underlying protocol stack. Default: 2920. Range: [100,2920]. If the received data length is greater than or equal to `<transmit size>`, it is pushed to the underlying protocol stack immediately, otherwise, the data waits for 20 ms and then is pushed to the protocol stack.

Note

- For devices with small throughput but high real-time requirements, it is recommended to set a smaller `<transmit size>`. It is also recommended to set TCP_NODELAY by [AT+CIPTCPOPT](#) command.
- For devices with large throughput, it is recommended to set a larger `<transmit size>`. It is also recommended to read [How to Improve ESP-AT Throughput Performance](#) first.

3.3.11 AT+CIPSENDEX: Send Data in the Normal Transmission Mode in Expanded Ways

Set Command

Function:

Set the data length to be send in *Normal Transmission Mode*, or use \0 (0x5c, 0x30 ASCII) to trigger data transmission.

Command:

```
// Single connection: (AT+CIPMUX=0)
AT+CIPSENDEX=<length>

// Multiple connections: (AT+CIPMUX=1)
AT+CIPSENDEX=<link ID>,<length>

// Remote host and port can be set for UDP transmission:
AT+CIPSENDEX=[<link ID>,<length>[,<"remote host">,<remote port>]
```

Response:

```
OK

>
```

This response indicates that AT is ready for receiving data. You should enter the data of designated length. When the data length reaches the <length> value, or when the string \0 appears in the data, the transmission starts.

If the connection cannot be established or gets disconnected during transmission, the system returns:

```
ERROR
```

If the data are successfully transmitted, the system returns:

```
SEND OK
```

Parameters

- **<link ID>**: ID of the connection (0~4), for multiple connections.
- **<length>**: data length. Maximum: 8192 bytes.
- **<"remote host">**: IPv4 address, IPv6 address, or domain name of remote host. It can be set in UDP transmission.
- **<remote port>**: remote port can be set in UDP transmission.

Notes

- When the requirement of data length is met, or when the string \0 (0x5c, 0x30 in ASCII) appears, the transmission of data starts. Go back to the normal command mode and wait for the next AT command.
- If the data contains the \<any>, it means that drop backslash symbol and only use <any> character.
- When sending \0, please use a backslash to escape it as \\0.
- You can use *AT+CIPTCP OPT* command to configure socket options for each TCP connection. For example, setting <so_sndtimeo> to 5000 will enable TCP send to return results within 5 seconds, whether it succeeds or fails. This can save the time that the MCU waits for AT command response.

3.3.12 AT+CIPCLOSE: Close TCP/UDP/SSL Connection

Set Command

Function:

Close TCP/UDP/SSL connection in the multiple connections mode.

Command:

```
AT+CIPCLOSE=<link ID>
```

Response:

```
<link ID>,CLOSED
```

```
OK
```

Execute Command

Function:

Close TCP/UDP/SSL connection in the single connection mode.

```
AT+CIPCLOSE
```

Response:

```
CLOSED
```

```
OK
```

Parameter

- **<link ID>**: ID of the connection that you want to close. If you set it to 5, all connections will be closed.

3.3.13 AT+CIFSR: Obtain the Local IP Address and MAC Address

Execute Command

Command:

```
AT+CIFSR
```

Response:

```
+CIFSR:APIP,<"APIP">
+CIFSR:APIP6LL,<"APIP6LL">
+CIFSR:APIP6GL,<"APIP6GL">
+CIFSR:APMAC,<"APMAC">
+CIFSR:STAIP,<"STAIP">
+CIFSR:STAIP6LL,<"STAIP6LL">
+CIFSR:STAIP6GL,<"STAIP6GL">
+CIFSR:STAMAC,<"STAMAC">
+CIFSR:ETHIP,<"ETHIP">
+CIFSR:ETHIP6LL,<"ETHIP6LL">
+CIFSR:ETHIP6GL,<"ETHIP6GL">
+CIFSR:ETHMAC,<"ETHMAC">
```

(continues on next page)

(continued from previous page)

OK

Parameters

- <" **APIP**" >: IPv4 address of Wi-Fi softAP interface
- <" **APIP6LL**" >: Linklocal IPv6 address of Wi-Fi softAP interface
- <" **APIP6GL**" >: Global IPv6 address of Wi-Fi softAP interface
- <" **APMAC**" >: MAC address of Wi-Fi softAP interface
- <" **STAIP**" >: IPv4 address of Wi-Fi station interface
- <" **STAIP6LL**" >: Linklocal IPv6 address of Wi-Fi station interface
- <" **STAIP6GL**" >: Global IPv6 address of Wi-Fi station interface
- <" **STAMAC**" >: MAC address of Wi-Fi station interface
- <" **ETHIP**" >: IPv4 address of ethernet interface
- <" **ETHIP6LL**" >: Linklocal IPv6 address of ethernet interface
- <" **ETHIP6GL**" >: Global IPv6 address of ethernet interface
- <" **ETHMAC**" >: MAC address of ethernet interface

Note

- Only when the ESP32-C2 has the valid interface information can you query its IP address and MAC address.

3.3.14 AT+CIPMUX: Enable/disable Multiple Connections

Query Command

Function:

Query the connection type.

Command:

AT+CIPMUX?

Response:

```
+CIPMUX:<mode>
OK
```

Set Command

Function:

Set the connection type.

Command:

AT+CIPMUX=<mode>

Response:

OK

Parameter

- **<mode>**: connection mode. Default: 0.
 - 0: single connection.
 - 1: multiple connections.

Notes

- This mode can only be changed after all connections are disconnected.
- If you want to set the multiple connections mode, ESP32-C2 should be in the *Normal Transmission Mode* (*AT+CIPMODE=0*).
- If you want to set the single connection mode when the TCP/SSL server is running, you should delete the server first. (*AT+CIPSERVER=0*).

Example

```
AT+CIPMUX=1
```

3.3.15 AT+CIPSERVER: Delete/create a TCP/SSL Server

Query Command

Function:

Query the TCP/SSL server status.

Command:

```
AT+CIPSERVER?
```

Response:

```
+CIPSERVER:<mode>[,<port>,<"type">][,<CA enable>]
```

```
OK
```

Set Command

Command:

```
AT+CIPSERVER=<mode>[,<param2>][,<"type">][,<CA enable>]
```

Response:

```
OK
```

Parameters

- **<mode>**:
 - 0: delete a server.
 - 1: create a server.
- **<param2>**: It means differently depending on the parameter **<mode>**:
 - If **<mode>** is 1, **<param2>** represents the port number. Default: 333.
 - If **<mode>** is 0, **<param2>** represents whether the server closes all connections. Default: 0.

- 0: shutdown the server and keep existing connections.
- 1: shutdown the server and close all connections.
- **<" type" >**: server type: "TCP" , "TCPv6" , "SSL" , or "SSLv6" . Default: "TCP" .
- **<CA enable>**:
 - 0: disable CA.
 - 1: enable CA.

Notes

- A TCP/SSL server can only be created when multiple connections are activated (*AT+CIPMUX=1*).
- A server monitor will be created automatically when the server is created. Only one server can be created at most.
- When a client is connected to the server, it will take up one connection and be assigned an ID.
- If you want to create a TCP/SSL server based on IPv6 network, set *AT+CIPV6=1* first, and obtain an IPv6 address.
- Parameters <"type"> and <CA enable> must be omitted when delete a server.

Example

```
// To create a TCP server
AT+CIPMUX=1
AT+CIPSERVER=1,80

// To create an SSL server
AT+CIPMUX=1
AT+CIPSERVER=1,443,"SSL",1

// To create an SSL server based on IPv6 network
AT+CIPMUX=1
AT+CIPSERVER=1,443,"SSLv6",0

// To delete an server and close all clients
AT+CIPSERVER=0,1
```

3.3.16 AT+CIPSERVERMAXCONN: Query/Set the Maximum Connections Allowed by a Server

Query Command

Function:

Obtain the maximum number of clients allowed to connect to the TCP/SSL server.

Command:

```
AT+CIPSERVERMAXCONN?
```

Response:

```
+CIPSERVERMAXCONN:<num>
OK
```

Set Command

Function:

Set the maximum number of clients allowed to connect to the TCP/SSL server.

Command:

```
AT+CIPSERVERMAXCONN=<num>
```

Response:

```
OK
```

Parameter

- **<num>**: the maximum number of clients allowed to connect to the TCP/SSL server. Range: [1,5]. For how to change the upper limit of this range, please refer to the description of the **<link ID>** parameter of the *AT+CIPSTART* command.

Note

- You should call the command `AT+CIPSERVERMAXCONN=<num>` before creating a server.

Example

```
AT+CIPMUX=1
AT+CIPSERVERMAXCONN=2
AT+CIPSERVER=1,80
```

3.3.17 AT+CIPMODE: Query/Set the Transmission Mode

Query Command**Function:**

Query the transmission mode.

Command:

```
AT+CIPMODE?
```

Response:

```
+CIPMODE:<mode>
OK
```

Set Command**Function:**

Set the transmission mode.

Command:

```
AT+CIPMODE=<mode>
```

Response:

```
OK
```

Parameter

- **<mode>**:
 - 0: *Normal Transmission Mode*.
 - 1: Wi-Fi *Passthrough Receiving Mode*, or called transparent receiving transmission, which can only be enabled in TCP single connection mode, UDP mode when the remote host and port do not change, or SSL single connection mode.

Notes

- The configuration changes will NOT be saved in flash.

Example

```
AT+CIPMODE=1
```

3.3.18 AT+SAVETRANSLINK: Set Whether to Enter Wi-Fi Passthrough Mode on Power-up

For TCP/SSL Single Connection

Set Command Command:

```
AT+SAVETRANSLINK=<mode>,<"remote host">,<remote port>[,<"type">,<keep_alive>]
```

Response:

```
OK
```

Parameters

- **<mode>**:
 - 0: ESP32-C2 will NOT enter Wi-Fi *Passthrough Mode* on power-up.
 - 1: ESP32-C2 will enter Wi-Fi *Passthrough Mode* on power-up.
- **<" remote host" >**: IPv4 address, IPv6 address, or domain name of remote host.
- **<remote port>**: the remote port number.
- **<" type" >**: string parameter showing the type of transmission: "TCP" , "TCPv6" , "SSL" , or "SSLv6" . Default: "TCP" .
- **<keep_alive>**: It configures the [SO_KEEPALIVE](#) option for socket. Unit: second.
 - Range: [0,7200].
 - * 0: disable keep-alive function (default).
 - * 1 ~ 7200: enable keep-alive function. [TCP_KEEPIPLE](#) value is **<keep_alive>**, [TCP_KEEPIPLE](#) value is 1, and [TCP_KEEPCNT](#) value is 3.
 - This parameter of this command is the same as the **<keep_alive>** parameter of [AT+CIPTCPOPT](#) command. It always takes the value set later by either of the two commands. If it is omitted or not set, the last configured value is used by default.

Notes

- This command will save the Wi-Fi *Passthrough Mode* configuration in the NVS area. If **<mode>** is set to 1, ESP32-C2 will enter the Wi-Fi *Passthrough Mode* in any subsequent power cycles. The configuration will take effect after ESP32-C2 reboots.
- As long as the remote host and port are valid, the configuration will be saved in flash.

- If you want to establish TCP/SSL connection based on IPv6 network, set *AT+CIPV6=1* first, and ensure the connected AP by *AT+CWJAP* supports IPv6 and esp-at got the IPv6 address which you can check it by AT+CIPSTA.

Example

```
AT+SAVETRANSLINK=1,"192.168.6.110",1002,"TCP"
AT+SAVETRANSLINK=1,"www.baidu.com",443,"SSL"
AT+SAVETRANSLINK=1,"240e:3a1:2070:11c0:55ce:4e19:9649:b75",8080,"TCPv6"
AT+SAVETRANSLINK=1,"240e:3a1:2070:11c0:55ce:4e19:9649:b75",8080,"SSLv6"
```

For UDP Transmission

Set Command Command:

```
AT+SAVETRANSLINK=<mode>,<"remote host">,<remote port>,[<"type">,<local port>]
```

Response:

```
OK
```

Parameters

- **<mode>**:
 - 0: ESP32-C2 will NOT enter Wi-Fi *Passthrough Mode* on power-up.
 - 1: ESP32-C2 will enter Wi-Fi *Passthrough Mode* on power-up.
- **<" remote host" >**: IPv4 address, IPv6 address, or domain name of remote host.
- **<remote port>**: the remote port number.
- **<" type" >**: string parameter showing the type of transmission: "UDP" or "UDPv6". Default: "TCP".
- **<local port>**: local port when UDP Wi-Fi passthrough is enabled on power-up.

Notes

- This command will save the Wi-Fi *Passthrough Mode* configuration in the NVS area. If <mode> is set to 1, ESP32-C2 will enter the Wi-Fi *Passthrough Mode* in any subsequent power cycles. The configuration will take effect after ESP32-C2 reboots.
- As long as the remote host and port are valid, the configuration will be saved in flash.
- If you want to establish UDP transmission based on IPv6 network, set *AT+CIPV6=1* first, and ensure the connected AP by *AT+CWJAP* supports IPv6 and esp-at got the IPv6 address which you can check it by AT+CIPSTA.

Example

```
AT+SAVETRANSLINK=1,"192.168.6.110",1002,"UDP",1005
AT+SAVETRANSLINK=1,"240e:3a1:2070:11c0:55ce:4e19:9649:b75",8081,"UDPv6",1005
```

3.3.19 AT+CIPSTO: Query/Set the local TCP/SSL Server Timeout

Query Command

Function:

Query the local TCP/SSL server timeout.

Command:

```
AT+CIPSTO?
```

Response:

```
+CIPSTO:<time>  
OK
```

Set Command**Function:**

Set the local TCP/SSL server timeout.

Command:

```
AT+CIPSTO=<time>
```

Response:

```
OK
```

Parameter

- **<time>**: local TCP/SSL server timeout. Unit: second. Range: [0,7200].

Notes

- When a TCP/SSL client does not communicate with the ESP32-C2 server within the <time> value, the server will terminate this connection.
- If you set <time> to 0, the connection will never timeout. This configuration is not recommended.
- When the client initiates a communication with the server within the set time, the timer will restart. After the timeout expires, the client is closed. During the set time, if the server initiate a communication with the client, the timer will not restart. After the timeout expires, the client is closed.

Example

```
AT+CIPMUX=1  
AT+CIPSERVER=1,1001  
AT+CIPSTO=10
```

3.3.20 AT+CIPSNTPCFG: Query/Set the Time Zone and the SNTP Server

Query Command**Command:**

```
AT+CIPSNTPCFG?
```

Response:

```
+CIPSNTPCFG:<enable>,<timezone>,<SNTP server1>[,<SNTP server2>,<SNTP server3>]  
OK
```

Set Command

Command:

```
AT+CIPSNTPCFG=<enable>,<timezone>[,<SNTP server1>,<SNTP server2>,<SNTP server3>]
```

Response:

```
OK
```

Parameters

- **<enable>**: configure the SNTP server:
 - 1: the SNTP server is configured.
 - 0: the SNTP server is not configured.
- **<timezone>**: support the following two formats:
 - The first format range is [-12,14]. It marks most of the time zones by offset from Coordinated Universal Time (UTC) in **whole hours** (**UTC-12:00** to **UTC+14:00**).
 - The second format is UTC offset. The UTC offset specifies the time value you must add to the UTC time to get a local time value. It has syntax like [+|-] [hh]mm. This is negative if the local time zone is on the west of the Prime Meridian and positive if it is on the east. The hour(hh) must be between -12 and 14, and the minute(mm) between 0 and 59. For example, if you want to set the timezone to New Zealand (Chatham Islands) which is in UTC+12:45, you should set the parameter <timezone> to 1245. Please refer to [UTC offset wiki](#) for more information.
- **[<SNTP server1>]**: the first SNTP server.
- **[<SNTP server2>]**: the second SNTP server.
- **[<SNTP server3>]**: the third SNTP server.

Note

- If the three SNTP servers are not configured, one of the following default servers will be used: “cn.ntp.org.cn”, “ntp.sjtu.edu.cn”, and “us.pool.ntp.org”.
- For the query command, <timezone> parameter in the response may be different from the <timezone> parameter in set command. Because the <timezone> parameter supports the second UTC offset format, for example, set AT+CIPSNTPCFG=1,015, for query command, ESP-AT ignores the leading zero of the <timezone> parameter, and the valid value is 15. It does not belong to the first format, so it is parsed according to the second UTC offset format, that is, UTC+00:15, that is, timezone is 0 in the response.

Example

```
// Enable SNTP server, set timezone to China (UTC+08:00)
AT+CIPSNTPCFG=1,8,"cn.ntp.org.cn","ntp.sjtu.edu.cn"
or
AT+CIPSNTPCFG=1,800,"cn.ntp.org.cn","ntp.sjtu.edu.cn"

// Enable SNTP server, set timezone to New York of the United States (UTC-05:00)
AT+CIPSNTPCFG=1,-5,"0.pool.ntp.org","time.google.com"
or
AT+CIPSNTPCFG=1,-500,"0.pool.ntp.org","time.google.com"

// Enable SNTP server, set timezone to New Zealand (Chatham Islands, UTC+12:45)
AT+CIPSNTPCFG=1,1245,"0.pool.ntp.org","time.google.com"
```

3.3.21 AT+CIPSNTPTIME: Query the SNTP Time

Query Command

Command:

```
AT+CIPSNTPTIME?
```

Response:

```
+CIPSNTPTIME:<asctime style time>  
OK
```

Note

- The asctime style time is defined at [asctime man page](#).

Example

```
AT+CWMODE=1  
AT+CWJAP="1234567890","1234567890"  
AT+CIPSNTPCFG=1,8,"cn.ntp.org.cn","ntp.sjtu.edu.cn"  
AT+CIPSNTPTIME?  
+CIPSNTPTIME:Tue Oct 19 17:47:56 2021  
OK  
  
or  
  
AT+CWMODE=1  
AT+CWJAP="1234567890","1234567890"  
AT+CIPSNTPCFG=1,530  
AT+CIPSNTPTIME?  
+CIPSNTPTIME:Tue Oct 19 15:17:56 2021  
OK
```

3.3.22 AT+CIPSNTPTINTV: Query/Set the SNTP time synchronization interval

Query Command

Command:

```
AT+CIPSNTPTINTV?
```

Response:

```
+CIPSNTPTINTV:<interval second>  
OK
```

Set Command

Command:

```
AT+CIPSNTPTINTV=<interval second>
```

Response:

OK

Parameters

- **<interval second>**: the SNTP time synchronization interval. Unit: second. Range: [15,4294967].

Notes

- It configures interval for synchronization, which means that it sets interval how often ESP32-C2 connects to NTP servers to get new time.

Example

```
AT+CIPSNTPCFG=1,8,"cn.ntp.org.cn","ntp.sjtu.edu.cn"
```

```
OK
```

```
// synchronize SNTP time every hour
```

```
AT+CIPSNTPIINTV=3600
```

```
OK
```

3.3.23 AT+CIPFWVER: Query the Existing AT Firmware Version on the Server

Query Command

Function:

Query the existing ESP32-C2 AT firmware version on the server.

Command:

```
AT+CIPFWVER?
```

Response:

```
+CIPFWVER:<"version">
```

```
OK
```

Parameters

- **<"version">**: ESP32-C2 AT firmware version.

Notes

- When selecting the OTA version to be upgraded, it is strongly not recommended to upgrade from a high version to a low version.

3.3.24 AT+CIUPDATE: Upgrade Firmware Through Wi-Fi

ESP-AT upgrades firmware at runtime by downloading the new firmware from a specific server through Wi-Fi and then flash it into some partitions.

Query Command

Function:

Query ESP32-C2 upgrade status.

Command:

```
AT+CIUPDATE?
```

Response:

```
+CIPUPDATE:<state>
OK
```

Execute Command

Function:

Upgrade OTA the latest version of firmware via TCP from the server in blocking mode.

Command:

```
AT+CIUPDATE
```

Response:

Please refer to the [response](#) in the set command.

Set Command

Function:

Upgrade the specified version of firmware from the server.

Command:

```
AT+CIUPDATE=<ota mode>[,<version>][,<firmware name>][,<nonblocking>]
```

Response:

If OTA succeeds in blocking mode, the system returns:

```
+CIPUPDATE:1
+CIPUPDATE:2
+CIPUPDATE:3
+CIPUPDATE:4
OK
```

If OTA succeeds in non-blocking mode, the system returns:

```
OK
+CIPUPDATE:1
+CIPUPDATE:2
+CIPUPDATE:3
+CIPUPDATE:4
```

If OTA fails in blocking mode, the system returns:

```
+CIPUPDATE:<state>
```

```
ERROR
```

If OTA fails in non-blocking mode, the system returns:

```
OK
```

```
+CIPUPDATE:<state>
```

```
+CIPUPDATE:-1
```

Parameters

- **<ota mode>:**
 - 0: OTA via HTTP.
 - 1: OTA via HTTPS. If it does not work, please check whether `./build.py menuconfig>Component config>AT>OTA based upon ssl` is enabled. For more information, please refer to [Compile ESP-AT Project](#).
- **<version>:** AT version, such as, `v1.2.0.0`, `v1.1.3.0`, `v1.1.2.0`.
- **<firmware name>:** firmware to upgrade, such as, `ota`, `mqtt_ca`, `client_ca` or other custom partition in `at_customize.csv`.
- **<nonblocking>:**
 - 0: OTA by blocking mode (In this mode, you can not send AT command until OTA completes successfully or fails.)
 - 1: OTA by non-blocking mode (You need to manually restart after upgrade done (+CIPUPDATE:4).)
- **<state>:**
 - 1: Server found.
 - 2: Connected to the server.
 - 3: Got the upgrade version.
 - 4: Upgrade done.
 - -1: OTA fails in non-blocking mode.

Notes

- The speed of the upgrade depends on the network status.
- If the upgrade fails due to unfavorable network conditions, AT will return `ERROR`. Please wait for some time before retrying.
- If you use Espressif's AT [BIN](#), `AT+CIPUPDATE` will download a new AT BIN from the Espressif Cloud.
- If you use a user-compiled AT BIN, you need to implement your own `AT+CIPUPDATE` FOTA function or use [AT+USEROTA](#) or [AT+WEBSEVER](#) command. ESP-AT project provides an example of [FOTA](#).
- After you upgrade the AT firmware, you are suggested to call the command [AT+RESTORE](#) to restore the factory default settings.
- The timeout of OTA process is 3 minutes.
- The response `OK` in non-blocking mode does not necessarily come before the response `+CIPUPDATE:<state>`. It may be output before `+CIPUPDATE:<state>` or after it.
- Upgraded to an older version is not recommended.
- Please refer to [How to Implement OTA Upgrade](#) for more OTA commands.

Example

```
AT+CWMODE=1
AT+CWJAP="1234567890","1234567890"
AT+CIPUPDATE
AT+CIPUPDATE=1
AT+CIPUPDATE=1,"v1.2.0.0"
AT+CIPUPDATE=1,"v2.2.0.0","mqtt_ca"
```

(continues on next page)

(continued from previous page)

```
AT+CIUPDATE=1,"v2.2.0.0","ota",1
AT+CIUPDATE=1,,,1
AT+CIUPDATE=1,"ota",1
AT+CIUPDATE=1,"v2.2.0.0",,1
```

3.3.25 AT+CIPDINFO: Set “+IPD” Message Mode

Query Command

Command:

```
AT+CIPDINFO?
```

Response:

```
+CIPDINFO:true
OK
```

or

```
+CIPDINFO:false
OK
```

Set Command

Command:

```
AT+CIPDINFO=<mode>
```

Response:

```
OK
```

Parameters

- **<mode>:**
 - 0: does not show the remote host and port in “+IPD” and “+CIPRECVDATA” messages.
 - 1: show the remote host and port in “+IPD” and “+CIPRECVDATA” messages.

Example

```
AT+CIPDINFO=1
```

3.3.26 AT+CIPSSLCONF: Query/Set SSL Clients

Query Command

Function:

Query the configuration of each connection where the ESP32-C2 runs as an SSL client.

Command:

```
AT+CIPSSLCCONF?
```

Response:

```
+CIPSSLCCONF:<link ID>,<auth_mode>,<pki_number>,<ca_number>
OK
```

Set Command**Command:**

```
// Single connection: (AT+CIPMUX=0)
AT+CIPSSLCCONF=<auth_mode>[,<pki_number>][,<ca_number>]

// Multiple connections: (AT+CIPMUX=1)
AT+CIPSSLCCONF=<link ID>,<auth_mode>[,<pki_number>][,<ca_number>]
```

Response:

```
OK
```

Parameters

- **<link ID>**: ID of the connection (0 ~ max). For multiple connections, if the value is max, it means all connections. By default, max is 5.
- **<auth_mode>**:
 - 0: no authentication. In this case <pki_number> and <ca_number> are not required.
 - 1: the client provides the client certificate for the server to verify.
 - 2: the client loads CA certificate to verify the server's certificate.
 - 3: mutual authentication.
- **<pki_number>**: the index of certificate and private key. If there is only one certificate and private key, the value should be 0.
- **<ca_number>**: the index of CA. If there is only one CA, the value should be 0.

Notes

- If you want this configuration to take effect immediately, run this command before establishing an SSL connection.
- The configuration changes will be saved in the NVS area. If you set the command [AT+SAVETRANSLINK](#) to enter SSL Wi-Fi *Passthrough Mode* on power-up, the ESP32-C2 will establish an SSL connection based on this configuration when powered up next time.
- If you want to use your own certificate or use multiple sets of certificates, please refer to the documentation: [How to Generate PKI Files](#).
- If <auth_mode> is configured to 2 or 3, in order to check the server certificate validity period, please make sure ESP32-C2 has obtained the current time before sending the [AT+CIPSTART](#) command. (You can send [AT+CIPSNTPCFG](#) command to configure SNTP and obtain the current time, and send [AT+CIPSNPTIME?](#) command to query the current time.)

3.3.27 AT+CIPSSLCCN: Query/Set the Common Name of the SSL Client

Query Command**Function:**

Query the common name of the SSL client of each connection.

Command:

```
AT+CIPSSLCCN?
```

Response:

```
+CIPSSLCCN:<link ID>,<"common name">
OK
```

Set Command**Command:**

```
// Single connection: (AT+CIPMUX=0)
AT+CIPSSLCCN=<"common name">

// Multiple connections: (AT+CIPMUX=1)
AT+CIPSSLCCN=<link ID>,<"common name">
```

Response:

```
OK
```

Parameters

- **<link ID>**: ID of the connection (0 ~ max). For the single connection, the link ID is 0. For multiple connections, if the value is max, it means all connections. Max is 5 by default.
- **<"common name">**: this parameter is used to verify the Common Name in the certificate sent by the server. The maximum length of `common name` is 64 bytes.

Note

- If you want this configuration to take effect immediately, run this command before establishing the SSL connection.

3.3.28 AT+CIPSSLCSNI: Query/Set SSL Client Server Name Indication (SNI)

Query Command**Function:**

Query the SNI configuration of each connection.

Command:

```
AT+CIPSSLCSNI?
```

Response:

```
+CIPSSLCSNI:<link ID>,<"sni">
OK
```

Set Command

Command:

```
Single connection: (AT+CIPMUX=0)
AT+CIPSSLCSNI=<"sni">

Multiple connections: (AT+CIPMUX=1)
AT+CIPSSLCSNI=<link ID>,<"sni">
```

Response:

```
OK
```

Parameters

- **<link ID>**: ID of the connection (0 ~ max). For the single connection, the link ID is 0. For multiple connections, if the value is max, it means all connections. Max is 5 by default.
- **<"sni">**: the Server Name Indication in ClientHello. The maximum length of `sni` is 64 bytes.

Notes

- If you want this configuration to take effect immediately, run this command before establishing the SSL connection.

3.3.29 AT+CIPSSLCALPN: Query/Set SSL Client Application Layer Protocol Negotiation (ALPN)

Query Command

Function:

Query the ALPN configuration of each connection where the ESP32-C2 runs as an SSL client.

Command:

```
AT+CIPSSLCALPN?
```

Response:

```
+CIPSSLCALPN:<link ID>[,<"alpn">][,<"alpn">][,<"alpn">]

OK
```

Set Command

Command:

```
// Single connection: (AT+CIPMUX=0)
AT+CIPSSLCALPN=<counts>[,<"alpn">][,<"alpn">][,<"alpn">]

// Multiple connections: (AT+CIPMUX=1)
AT+CIPSSLCALPN=<link ID>,<counts>[,<"alpn">][,<"alpn">][,<"alpn">]
```

Response:

OK

Parameters

- **<link ID>**: ID of the connection (0 ~ max). For the single connection, the link ID is 0. For multiple connections, if the value is max, it means all connections. Max is 5 by default.
- **<counts>**: the number of ALPNs. Range: [0,5].
- 0: clean the ALPN configuration.
- [1,5]: set the ALPN configuration.
- **<" alpn" >**: a string paramemter showing the ALPN in ClientHello. The maximum length of alpn is limited by the command length.

Note

- If you want this configuration to take effect immediately, run this command before establishing the SSL connection.

3.3.30 AT+CIPSSLCPSK: Query/Set SSL Client Pre-shared Key (PSK)

Query Command

Function:

Query the PSK configuration of each connection where the ESP32-C2 runs as an SSL client.

Command:

AT+CIPSSLCPSK?

Response:

+CIPSSLCPSK:<link ID>,<"psk">,<"hint">
OK

Set Command

Command:

// Single connection: (AT+CIPMUX=0)
AT+CIPSSLCPSK=<"psk">,<"hint">

// Multiple connections: (AT+CIPMUX=1)
AT+CIPSSLCPSK=<link ID>,<"psk">,<"hint">

Response:

OK

Parameters

- **<link ID>**: ID of the connection (0 ~ max). For single connection, <link ID> is 0. For multiple connections, if the value is max, it means all connections, max is 5 by default.
- **<" psk" >**: PSK identity. Maximum length: 32.
- **<" hint" >**: PSK hint. Maximum length: 32.

Notes

- If you want this configuration to take effect immediately, run this command before establishing the SSL connection.

3.3.31 AT+CIPRECONNINTV: Query/Set the TCP/UDP/SSL reconnection Interval for the Wi-Fi Passthrough Mode**Query Command****Function:**

Query the automatic connect interval for the Wi-Fi *Passthrough Mode*.

Command:

```
AT+CIPRECONNINTV?
```

Response:

```
+CIPRECONNINTV:<interval>
OK
```

Set Command**Function:**

Set the automatic reconnecting interval when TCP/UDP/SSL transmission breaks in the Wi-Fi *Passthrough Mode*.

Command:

```
AT+CIPRECONNINTV=<interval>
```

Response:

```
OK
```

Parameter

- **<interval>**: the duration between automatic reconnections. Unit: 100 milliseconds. Default: 1. Range: [1,36000].

Note

- The configuration changes will be saved in the NVS area if *AT+SYSTORE=1*.

Example

```
AT+CIPRECONNINTV=10
```

3.3.32 AT+CIPRECVMODE: Query/Set Socket Receiving Mode

Query Command

Function:

Query the socket receiving mode.

Command:

```
AT+CIPRECVMODE?
```

Response:

```
+CIPRECVMODE:<mode>
OK
```

Set Command

Command:

```
AT+CIPRECVMODE=<mode>
```

Response:

```
OK
```

Parameter

- **<mode>**: the receive mode of socket data. Default: 0.
 - 0: active mode. ESP-AT will send all the received socket data instantly to the host MCU with the header “+IPD” . (The socket receive window is 5760 bytes by default. The maximum valid bytes sent to MCU is 2920 bytes each time.)
 - 1: passive mode. ESP-AT will keep the received socket data in an internal buffer (socket receive window, 5760 bytes by default), and wait for the host MCU to read. If the buffer is full, the socket transmission will be blocked for TCP/SSL connections, or data will be lost for UDP connections.

Notes

- The configuration can not be used in the Wi-Fi *Passthrough Mode*. If it is a UDP transmission in passive mode, data will be lost when the buffer is full.
- When ESP-AT receives socket data in passive mode, it will prompt the following messages in different scenarios:
 - For multiple connections mode (AT+CIPMUX=1), the message is +IPD, <link ID>, <len>.
 - For single connection mode (AT+CIPMUX=0), the message is +IPD, <len>.
- <len> is the total length of socket data in the buffer.
- You should read data by running [AT+CIPRECVDATA](#) once there is a +IPD reported. Otherwise, the next +IPD will not be reported to the host MCU until the previous +IPD has been read.
- In case of disconnection, the buffered socket data will still be there and can be read by the MCU until you send [AT+CIPCLOSE](#) (AT as client) or [AT+CIPSERVER=0,1](#) (AT as server). In other words, if +IPD has been reported, the message CLOSED of this connection will never come until you send [AT+CIPCLOSE](#) or [AT+CIPSERVER=0,1](#) or read all data by command [AT+CIPRECVDATA](#).

Example

```
AT+CIPRECVMODE=1
```

3.3.33 AT+CIPRECVDATA: Obtain Socket Data in Passive Receiving Mode**Set Command****Command:**

```
// Single connection: (AT+CIPMUX=0)
AT+CIPRECVDATA=<len>

// Multiple connections: (AT+CIPMUX=1)
AT+CIPRECVDATA=<link_id>,<len>
```

Response:

```
+CIPRECVDATA:<actual_len>,<data>
OK
```

or

```
+CIPRECVDATA:<actual_len>,<"remote IP">,<remote port>,<data>
OK
```

Parameters

- **<link_id>**: connection ID in multiple connections mode.
- **<len>**: the max value is 0x7fffff. If the actual length of the received data is less than len, the actual length will be returned.
- **<actual_len>**: length of the data you actually obtain.
- **<data>**: the data you want to obtain.
- **<"remote IP">**: string parameter showing the remote IPv4 address or IPv6 address, enabled by the command [AT+CIPDINFO=1](#).
- **<remote port>**: the remote port number, enabled by the command [AT+CIPDINFO=1](#).

Example

```
AT+CIPRECVMODE=1

// For example, if host MCU gets a message of receiving 100-byte data in
↳connection with No.0,
// the message will be "+IPD,0,100".
// Then you can read those 100-byte data by using the command below.
AT+CIPRECVDATA=0,100
```

3.3.34 AT+CIPRECLEN: Obtain Socket Data Length in Passive Receiving Mode**Query Command****Function:**

Query the length of the entire data buffered for the connection.

Command:

```
AT+CIPRECLEN?
```

Response:

```
+CIPRECLEN:<data length of link0>,<data length of link1>,<data length of link2>,  
↪<data length of link3>,<data length of link4>  
OK
```

Parameters

- **<data length of link>**: length of the entire data buffered for the connection.

Note

- For SSL connections, ESP-AT will return the length of the encrypted data, so the returned length will be larger than the real data length.

Example

```
AT+CIPRECLEN?  
+CIPRECLEN:100,,,,,  
OK
```

3.3.35 AT+PING: Ping the Remote Host

Set Command**Function:**

Ping the remote host.

Command:

```
AT+PING=<"host">
```

Response:

```
+PING:<time>  
OK
```

or

```
+PING:TIMEOUT // esp-at returns this response only when the domain name  
↪resolution failure or ping timeout  
ERROR
```

Parameters

- **<"host">**: string parameter showing the host IPv4 address or IPv6 address or domain name.
- **<time>**: the response time of ping. Unit: millisecond.

Notes

- If you want to ping a remote host based on IPv6 network, set *AT+CIPV6=1* first, and ensure the connected AP by *AT+CWJAP* supports IPv6 and esp-at got the IPv6 address which you can check it by AT+CIPSTA.
- If the remote host is a domain name string, ping will first resolve the domain name (IPv4 address preferred) from DNS (domain name server), and then ping the remote IP address.

Example

```
AT+PING="192.168.1.1"  
AT+PING="www.baidu.com"  
  
// China Future Internet Engineering Center  
AT+PING="240c::6666"
```

3.3.36 AT+CIPDNS: Query/Set DNS Server Information

Query Command

Function:

Query the current DNS server information.

Command:

```
AT+CIPDNS?
```

Response:

```
+CIPDNS:<enable>[,<"DNS IP1">][,<"DNS IP2">][,<"DNS IP3">]  
OK
```

Set Command

Function:

Set DNS server information.

Command:

```
AT+CIPDNS=<enable>[,<"DNS IP1">][,<"DNS IP2">][,<"DNS IP3">]
```

Response:

```
OK
```

or

```
ERROR
```

Parameters

- **<enable>**: configure DNS server settings
 - 0: Enable automatic DNS server settings from DHCP. The DNS will be restored to 208.67.222.222 and 8.8.8.8. Only when the ESP32-C2 station completes the DHCP process, the DNS server of the ESP32-C2 station could be updated.

- 1: Enable manual DNS server settings. If you do not set a value for <DNS IPx>, it will use 208.67.222.222 and 8.8.8.8 by default.
- <" DNS IP1" >: the first DNS server IP address. For the set command, this parameter only works when you set <enable> to 1, i.e. enable manual DNS settings. If you set <enable> to 1 and a value for this parameter, the ESP-AT will return this parameter as the current DNS setting when you run the query command.
- <" DNS IP2" >: the second DNS server IP address. For the set command, this parameter only works when you set <enable> to 1, i.e. enable manual DNS settings. If you set <enable> to 1 and a value for this parameter, the ESP-AT will return this parameter as the current DNS setting when you run the query command.
- <" DNS IP3" >: the third DNS server IP address. For the set command, this parameter only works when you set <enable> to 1, i.e. enable manual DNS settings. If you set <enable> to 1 and a value for this parameter, the ESP-AT will return this parameter as the current DNS setting when you run the query command.

Notes

- The configuration changes will be saved in the NVS area if *AT+SYSTORE=1*.
- The three parameters cannot be set to the same server.
- When <enable> is set to 1, the DNS server may change according to the configuration of the router which the ESP32-C2 is connected to.

Example

```
AT+CIPDNS=0
AT+CIPDNS=1, "208.67.222.222", "114.114.114.114", "8.8.8.8"

// first DNS Server based on IPv6: China Future Internet Engineering Center
// second DNS Server based on IPv6: google-public-dns-a.google.com
// third DNS Server based on IPv6: main DNS Server based on IPv6 in JiangSu
↪Province, China
AT+CIPDNS=1, "240c::6666", "2001:4860:4860::8888", "240e:5a::6666"
```

3.3.37 AT+CIPTCPOPT: Query/Set the Socket Options

Query Command

Function:

Query current socket options.

Command:

```
AT+CIPTCPOPT?
```

Response:

```
+CIPTCPOPT:<link_id>,<so_linger>,<tcp_nodelay>,<so_sndtimeo>,<keep_alive>
OK
```

Set Command

Command:

```
// Single TCP connection (AT+CIPMUX=0):
AT+CIPTCPOPT=[<so_linger>],[<tcp_nodelay>],[<so_sndtimeo>],[<keep_alive>]

// Multiple TCP Connections (AT+CIPMUX=1):
AT+CIPTCPOPT=<link ID>,[<so_linger>],[<tcp_nodelay>],[<so_sndtimeo>],[<keep_alive>]
```

Response:

OK

or

ERROR

Parameters

- **<link_id>**: ID of the connection (0 ~ max). For multiple connections, if the value is max, it means all connections. By default, max is 5.
- **<so_linger>**: configure the `SO_LINGER` options for the socket (refer to [SO_LINGER description](#)). Unit: second. Default: -1.
 - = -1: off
 - = 0: on, linger time = 0
 - > 0: on, linger time = <so_linger>
- **<tcp_nodelay>**: configure the `TCP_NODELAY` option for the socket (refer to [TCP_NODELAY description](#)). Default: 0.
 - 0: disable `TCP_NODELAY`
 - 1: enable `TCP_NODELAY`
- **<so_sndtimeo>**: configure the `SO_SNDTIMEO` option for socket (refer to [SO_SNDTIMEO description](#)). Unit: millisecond. Default: 0.
- **<keep_alive>**: configure the `SO_KEEPALIVE` option for socket. Unit: second.
 - Range: [0,7200].
 - * 0: disable keep-alive function (default).
 - * 1 ~ 7200: enable keep-alive function. [TCP_KEEPIPLE](#) value is <keep_alive>, [TCP_KEEPIPLE](#) value is 1, and [TCP_KEEPCNT](#) value is 3.
 - This parameter of this command is the same as the <keep_alive> parameter of [AT+CIPSTART](#) command. It always takes the value set later by either of the two commands. If it is omitted or not set, the last configured value is used by default.

Notes

- Before configuring these socket options, **please make sure you fully understand the function of them and the possible impact after configuration.**
- The `SO_LINGER` option is not recommended to be set to a large value. For example, if you set `SO_LINGER` value to 60, then [AT+CIPCLOSE](#) command will block for 60 seconds if ESP32-C2 cannot receive TCP FIN packet from the remote TCP peer due to network issues, so ESP32-C2 is unable to respond to any other AT commands. Therefore, it is recommended to keep the default value of the `SO_LINGER` option.
- The `TCP_NODELAY` option is used for situations with small throughput but high real-time requirements. If this option is enabled, [LwIP](#) will speed up TCP transmission, but in a poor network environment, the throughput will be reduced due to retransmission. Therefore, it is recommended to keep the default value of the `TCP_NODELAY` option.
- The `SO_SNDTIMEO` option is used for situations where the keepalive parameter is not configured in [AT+CIPSTART](#) command. After this option is configured, [AT+CIPSEND](#), [AT+CIPSENDL](#), and [AT+CIPSENDEX](#) commands will exit within this timeout, regardless of whether data are sent successfully or not. Here, `SO_SNDTIMEO` is recommended to be set to 5 ~ 10 seconds.
- The `SO_KEEPALIVE` option is used for actively and regularly detecting whether the connection is disconnected. It is generally recommended to configure this option when AT is used as a TCP server. After this option is configured, additional network bandwidth will be cost. Recommended value of `SO_KEEPALIVE` should be not less than 60 seconds.

3.4 Bluetooth® Low Energy AT Commands

Attention: ESP32C2-4MB AT firmware supports BluFi, but ESP32C2-2MB AT firmware does not. If you need the firmware with BluFi support on ESP32C2-2MB, please compile it on your own by following [Compile ESP-AT Project](#) and choosing the following configurations in the Step 5. Configure:

- Component config -> Bluetooth -> Bluetooth -> Host -> NimBLE - BLE only
- Component config -> Bluetooth -> NimBLE Options -> Enable blufi functionality

- [AT+BLUFI](#): Start or Stop BluFi.
- [AT+BLUFINAME](#): Query/Set BluFi device name.
- [AT+BLUFISEND](#): Send user-customized data over BluFi.

3.4.1 AT+BLUFI: Start or Stop BluFi

Query Command

Function:

Query the status of BluFi.

Command:

```
AT+BLUFI?
```

Response:

If BluFi is not started, it will return:

```
+BLUFI:0
```

```
OK
```

If BluFi is started, it will return:

```
+BLUFI:1
```

```
OK
```

Set Command

Function:

Start or stop BluFi.

Command:

```
AT+BLUFI=<option>[,<auth floor>]
```

Response:

```
OK
```

Parameter

- **<option>**:
 - 0: stop BluFi
 - 1: start BluFi
- **<auth floor>**: Wi-Fi authentication mode floor. ESP-AT will not connect to the AP whose authmode is lower than this floor.
 - 0: OPEN (Default)
 - 1: WEP
 - 2: WPA_PSK
 - 3: WPA2_PSK
 - 4: WPA_WPA2_PSK
 - 5: WPA2_ENTERPRISE
 - 6: WPA3_PSK
 - 7: WPA2_WPA3_PSK

Example

```
AT+BLUFI=1
```

3.4.2 AT+BLUFINAME: Query/Set BluFi Device Name

Query Command**Function:**

Query the BluFi name.

Command:

```
AT+BLUFINAME?
```

Response:

```
+BLUFINAME:<device_name>  
OK
```

Set Command**Function:**

Set the BluFi device name.

Command:

```
AT+BLUFINAME=<device_name>
```

Response:

```
OK
```

Parameter

- **<device_name>**: the name of BluFi device.

Notes

- If you need to set BluFi name, please set it before command `AT+BLUFI=1`. Otherwise, it will use the default name `BLUFI_DEVICE`.
- The maximum length of BluFi name is 29 bytes.

Example

```
AT+BLUFINAME="BLUFI_DEV"  
AT+BLUFINAME?
```

3.4.3 AT+BLUFISEND: Send User-Customized Data over BluFi

Set Command

Function:

Send user-customized data from the ESP side to a phone over BluFi.

Command:

```
AT+BLUFISEND=<length>
```

Response:

```
>
```

The symbol `>` indicates that AT is ready for receiving serial data and you can enter data now. When the requirement of data length determined by the parameter `<length>` is met, the transmission starts.

If the data transmission is successful, AT returns:

```
OK
```

Parameters

- `<length>`: customized data length. Unit: byte.

Notes

- The length of customized data cannot exceed 600 bytes.
- If your ESP chip receives customized data from the phone, the data will be printed in the form of `+BLUFI-DATA:<len>,<data>`.

Example

```
AT+BLUFISEND=4  
// After the symbol ">" shows, input 4 bytes of data, such as "1234". Then the_  
↵data will be transmitted automatically.
```

3.5 MQTT AT Commands

- [*AT+MQTTUSERCFG*](#): Set MQTT user configuration
- [*AT+MQTTLONGCLIENTID*](#): Set MQTT client ID
- [*AT+MQTTLONGUSERNAME*](#): Set MQTT username
- [*AT+MQTTLONGPASSWORD*](#): Set MQTT password
- [*AT+MQTTCONNCFG*](#): Set configuration of MQTT connection
- [*AT+MQTTALPN*](#): Set MQTT Application Layer Protocol Negotiation (ALPN)
- [*AT+MQTTCONN*](#): Connect to MQTT Brokers
- [*AT+MQTTPUB*](#): Publish MQTT Messages in string
- [*AT+MQTTPUBRAW*](#): Publish long MQTT messages
- [*AT+MQTTSUB*](#): Subscribe to MQTT topics
- [*AT+MQTTUNSUB*](#): Unsubscribe from MQTT topics
- [*AT+MQTTCLEAN*](#): Close MQTT connections
- [*MQTT AT Error Codes*](#)
- [*MQTT AT Notes*](#)

3.5.1 AT+MQTTUSERCFG: Set MQTT User Configuration

Set Command

Function:

Set MQTT User Configuration.

Command:

```
AT+MQTTUSERCFG=<LinkID>,<scheme>,<"client_id">,<"username">,<"password">,<cert_key_
↪ ID>,<CA_ID>,<"path">
```

Response:

```
OK
```

Parameters

- **<LinkID>**: currently only supports link ID 0.
- **<scheme>**:
 - 1: MQTT over TCP.
 - 2: MQTT over TLS (no certificate verify).
 - 3: MQTT over TLS (verify server certificate).
 - 4: MQTT over TLS (provide client certificate).
 - 5: MQTT over TLS (verify server certificate and provide client certificate).
 - 6: MQTT over WebSocket (based on TCP).
 - 7: MQTT over WebSocket Secure (based on TLS, no certificate verify).
 - 8: MQTT over WebSocket Secure (based on TLS, verify server certificate).
 - 9: MQTT over WebSocket Secure (based on TLS, provide client certificate).
 - 10: MQTT over WebSocket Secure (based on TLS, verify server certificate and provide client certificate).
- **<client_id>**: MQTT client ID. Maximum length: 256 bytes.
- **<username>**: the username to login to the MQTT broker. Maximum length: 64 bytes.
- **<password>**: the password to login to the MQTT broker. Maximum length: 64 bytes.
- **<cert_key_ID>**: certificate ID. Currently, ESP-AT only supports one certificate for ID 0.
- **<CA_ID>**: CA ID. Currently, ESP-AT only supports one CA for ID 0.
- **<path>**: the path of the resource. Maximum length: 32 bytes.

Note

- The length of the entire AT command should be less than 256 bytes.
- If <scheme> is configured to 3, 5, 8, or 10, in order to check the server certificate validity period, please make sure ESP32-C2 has obtained the current time before sending the [AT+MQTTCONN](#) command. (You can send [AT+CIPSNTPCFG](#) command to configure SNTP and obtain the current time, and send [AT+CIPSNPTIME?](#) command to query the current time.)

3.5.2 AT+MQTTLONGCLIENTID: Set MQTT Client ID

Set Command**Function:**

Set MQTT Client ID.

Command:

```
AT+MQTTLONGCLIENTID=<LinkID>,<length>
```

Response:

```
OK
```

```
>
```

This response indicates that AT is ready for receiving MQTT Client ID. You should enter the Client ID, and when the Client ID length reaches the <length> value, the system returns:

```
OK
```

Parameters

- **<LinkID>**: currently only supports link ID 0.
- **<length>**: MQTT client ID length. Range: [1,1024].

Notes

- The command [AT+MQTTUSERCFG](#) can also set MQTT client ID. The differences between the two commands include:
 - You can use AT+MQTTLONGCLIENTID to set a relatively long client ID since there is a limitation on the length of the AT+MQTTUSERCFG command.
 - You should set AT+MQTTLONGCLIENTID after setting the AT+MQTTUSERCFG command.

3.5.3 AT+MQTTLONGUSERNAME: Set MQTT Username

Set Command**Function:**

Set MQTT username.

Command:

```
AT+MQTTLONGUSERNAME=<LinkID>,<length>
```

Response:

```
OK
```

```
>
```

This response indicates that AT is ready for receiving MQTT username. You should enter the MQTT username, and when the MQTT username length reaches the `<length>` value, the system returns:

```
OK
```

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<length>**: MQTT username length. Range: [1,1024].

Notes

- The command [*AT+MQTTUSERCFG*](#) can also set MQTT username. The differences between the two commands include:
 - You can use `AT+MQTTLONGUSERNAME` to set a relatively long username since there is a limitation on the length of the `AT+MQTTUSERCFG` command.
 - You should set `AT+MQTTLONGUSERNAME` after setting the command `AT+MQTTUSERCFG`.

3.5.4 AT+MQTTLONGPASSWORD: Set MQTT Password

Set Command

Function:

Set MQTT password.

Command:

```
AT+MQTTLONGPASSWORD=<LinkID>,<length>
```

Response:

```
OK
```

```
>
```

This response indicates that AT is ready for receiving MQTT password. You should enter the MQTT password, and when the MQTT password length reaches the `<length>` value, the system returns:

```
OK
```

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<length>**: MQTT password length. Range: [1,1024].

Notes

- The command [*AT+MQTTUSERCFG*](#) can also set MQTT password. The differences between the two commands include:

- You can use AT+MQTTLONGPASSWORD to set a relatively long password since there is a limitation on the length of the AT+MQTTUSERCFG command.
- You should set AT+MQTTLONGPASSWORD after setting the command AT+MQTTUSERCFG.

3.5.5 AT+MQTTCONNCFG: Set Configuration of MQTT Connection

Set Command

Function:

Set configuration of MQTT Connection.

Command:

```
AT+MQTTCONNCFG=<LinkID>,<keepalive>,<disable_clean_session>,<"lwt_topic">,<"lwt_msg"  
↔">,<lwt_qos>,<lwt_retain>
```

Response:

```
OK
```

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<keepalive>**: timeout of MQTT ping. Unit: second. Range [0,7200]. The default value is 0, which will be force-changed to 120 s.
- **<disable_clean_session>**: set MQTT clean session. For more details about this parameter, please refer to the section [Clean Session](#) in *MQTT Version 3.1.1*.
 - 0: enable clean session.
 - 1: disable clean session.
- **<lwt_topic>**: LWT (Last Will and Testament) message topic. Maximum length: 128 bytes.
- **<lwt_msg>**: LWT message. Maximum length: 64 bytes.
- **<lwt_qos>**: LWT QoS, which can be set to 0, 1, or 2. Default: 0.
- **<lwt_retain>**: LWT retain, which can be set to 0 or 1. Default: 0.

3.5.6 AT+MQTTALPN: Set MQTT Application Layer Protocol Negotiation (ALPN)

Set Command

Function:

Set MQTT Application Layer Protocol Negotiation (ALPN).

Command:

```
AT+MQTTALPN=<LinkID>,<alpn_counts>[,<"alpn">][,<"alpn">][,<"alpn">]
```

Response:

```
OK
```

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<alpn_counts>**: the number of <" alpn" > parameters. Range: [0,5].
- 0: clean the MQTT ALPN configuration.

- [1,5]: set the MQTT ALPN configuration.
- <" alpn" >: you can send more than one ALPN in ClientHello to the server.

Notes

- The length of the entire AT command should be less than 256 bytes.
- MQTT ALPN will only be effective if the MQTT connection is based on TLS or WSS.
- You should set AT+MQTTALPN after setting the command AT+MQTTUSERCFG.

Example

```
AT+CWMODE=1
AT+CWJAP="ssid", "password"
AT+CIPSNTPCFG=1,8,"ntp1.aliyun.com","ntp2.aliyun.com"
AT+MQTTUSERCFG=0,5,"ESP32-C2","espressif","1234567890",0,0,""
AT+MQTTALPN=0,2,"mqtt-ca.cn","mqtt-ca.us"
AT+MQTTCONN=0,"192.168.200.2",8883,1
```

3.5.7 AT+MQTTCONN: Connect to MQTT Brokers

Query Command

Function:

Query the MQTT broker that ESP32-C2 are connected to.

Command:

```
AT+MQTTCONN?
```

Response:

```
+MQTTCONN:<LinkID>,<state>,<scheme><"host">,<port>,<"path">,<reconnect>
OK
```

Set Command

Function:

Connect to an MQTT broker.

Command:

```
AT+MQTTCONN=<LinkID>,<"host">,<port>,<reconnect>
```

Response:

```
OK
```

Parameters

- <LinkID>: only supports link ID 0 currently.
- <host>: MQTT broker domain. Maximum length: 128 bytes.
- <port>: MQTT broker port. Maximum: port 65535.
- <path>: path. Maximum length: 32 bytes.

- **<reconnect>**:
 - 0: MQTT will not reconnect automatically. If MQTT connection established and then disconnected, you cannot use this command to reestablish MQTT connection. Please send [AT+MQTTCLEAN=0](#) command to clean MQTT connection first, reconfigure the connection parameters, and then establish a new MQTT connection.
 - 1: MQTT will reconnect automatically. It takes more resources.
- **<state>**: MQTT state.
 - 0: MQTT uninitialized.
 - 1: already set AT+MQTTUSERCFG.
 - 2: already set AT+MQTTCONNCFG.
 - 3: connection disconnected.
 - 4: connection established.
 - 5: connected, but did not subscribe to any topic.
 - 6: connected, and subscribed to MQTT topics.
- **<scheme>**:
 - 1: MQTT over TCP.
 - 2: MQTT over TLS (no certificate verify).
 - 3: MQTT over TLS (verify server certificate).
 - 4: MQTT over TLS (provide client certificate).
 - 5: MQTT over TLS (verify server certificate and provide client certificate).
 - 6: MQTT over WebSocket (based on TCP).
 - 7: MQTT over WebSocket Secure (based on TLS, verify no certificate).
 - 8: MQTT over WebSocket Secure (based on TLS, verify server certificate).
 - 9: MQTT over WebSocket Secure (based on TLS, provide client certificate).
 - 10: MQTT over WebSocket Secure (based on TLS, verify server certificate and provide client certificate).

3.5.8 AT+MQTTPUB: Publish MQTT Messages in String

Set Command

Function:

Publish MQTT messages in string to a defined topic. If the amount of data you publish is relatively large, and the length of a single AT command has exceeded the threshold of 256, please use the [AT+MQTTPUBRAW](#) command.

Command:

`AT+MQTTPUB=<LinkID>,<"topic">,<"data">,<qos>,<retain>`

Response:

`OK`

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<topic>**: MQTT topic. Maximum length: 128 bytes.
- **<data>**: MQTT message in string.
- **<qos>**: QoS of message, which can be set to 0, 1, or 2. Default: 0.
- **<retain>**: retain flag.

Notes

- The length of the entire AT command should be less than 256 bytes.
- This command cannot send data \0. If you need to send \0, please use the command [AT+MQTTPUBRAW](#) instead.

Example

```
AT+CWMODE=1
AT+CWJAP="ssid","password"
AT+MQTTUSERCFG=0,1,"ESP32-C2","espressif","1234567890",0,0,""
AT+MQTTCONN=0,"192.168.10.234",1883,0
AT+MQTTPUB=0,"topic","\"{\\"timestamp\\":\\"20201121085253\\"}\"",0,0
```

3.5.9 AT+MQTTPUBRAW: Publish Long MQTT Messages

Set Command**Function:**

Publish long MQTT messages to a defined topic. If the amount of data you publish is relatively small, and the length of a single AT command is not greater than the threshold of 256, you also can use the [AT+MQTTPUB](#) command.

Command:

```
AT+MQTTPUBRAW=<LinkID>,<"topic">,<length>,<qos>,<retain>
```

Response:

```
OK
>
```

The symbol > indicates that AT is ready for receiving serial data, and you can enter the data now. When the requirement of message length determined by the parameter <length> is met, the transmission starts.

If the transmission is successful, AT returns:

```
+MQTTPUB:OK
```

Otherwise, it returns:

```
+MQTTPUB:FAIL
```

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<topic>**: MQTT topic. Maximum length: 128 bytes.
- **<length>**: length of MQTT message. The maximum length is limited by available memory.
- **<qos>**: QoS of the published message, which can be set to 0, 1, or 2. Default is 0.
- **<retain>**: retain flag.

3.5.10 AT+MQTTSUB: Subscribe to MQTT Topics

Query Command**Function:**

List all MQTT topics that have been already subscribed.

Command:

```
AT+MQTTSUB?
```

Response:

```
+MQTTSUB:<LinkID>,<state>,<"topic1">,<qos>
+MQTTSUB:<LinkID>,<state>,<"topic2">,<qos>
+MQTTSUB:<LinkID>,<state>,<"topic3">,<qos>
...
OK
```

Set Command

Function:

Subscribe to defined MQTT topics with defined QoS. It supports subscribing to multiple topics.

Command:

```
AT+MQTTSUB=<LinkID>,<"topic">,<qos>
```

Response:

```
OK
```

When AT receives MQTT messages of the subscribed topic, it will prompt:

```
+MQTTSUBRECV:<LinkID>,<"topic">,<data_length>,<data>
```

If the topic has been subscribed before, it will prompt:

```
ALREADY SUBSCRIBE
```

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<state>**: MQTT state.
 - 0: MQTT uninitialized.
 - 1: already set AT+MQTTUSERCFG.
 - 2: already set AT+MQTTCONNCFG.
 - 3: connection disconnected.
 - 4: connection established.
 - 5: connected, but subscribe to no topic.
 - 6: connected, and subscribed to MQTT topics.
- **<topic>**: the topic that is subscribed to.
- **<qos>**: the QoS that is subscribed to.

3.5.11 AT+MQTTUNSUB: Unsubscribe from MQTT Topics

Set Command

Function:

Unsubscribe the client from defined topics. This command can be called multiple times to unsubscribe from different topics.

Command:

```
AT+MQTTUNSUB=<LinkID>,<"topic">
```

Response:

OK

If the topic has not been subscribed, AT will prompt:

NO UNSUBSCRIBE

OK

Parameters

- **<LinkID>**: only supports link ID 0 currently.
- **<topic>**: MQTT topic. Maximum length: 128 bytes.

3.5.12 AT+MQTTCLEAN: Close MQTT Connections

Set Command

Function:

Close the MQTT connection and release the resource.

Command:

AT+MQTTCLEAN=<LinkID>

Response:

OK

Parameter

- **<LinkID>**: only supports link ID 0 currently.

3.5.13 MQTT AT Error Codes

The MQTT Error code will be prompted as `ERR CODE:0x<%08x>`.

Error Type	Error Code
AT_MQTT_NO_CONFIGURED	0x6001
AT_MQTT_NOT_IN_CONFIGURED_STATE	0x6002
AT_MQTT_UNINITIATED_OR_ALREADY_CLEAN	0x6003

3.5.14 MQTT AT Notes

- In general, AT MQTT commands responds within 10 s, except the command AT+MQTTCONN. For example, if the router fails to access the Internet, the command AT+MQTTPUB will respond within 10 s. But the command AT+MQTTCONN may need more time due to packet retransmission in a bad network environment.
- If the AT+MQTTCONN is based on a TLS connection, the timeout of each packet is 10 s, and the total timeout will be much longer depending on the handshake packets count.
- When the MQTT connection ends, it will prompt the message +MQTTDISCONNECTED:<LinkID>.
- When the MQTT connection established, it will prompt the message +MQTTCONNECTED:<LinkID>, <scheme>, <"host">, port, <"path">, <reconnect>.

3.6 HTTP AT Commands

- [AT+HTTPCLIENT](#): Send HTTP Client Request
- [AT+HTTPGETSIZE](#): Get HTTP Resource Size
- [AT+HTTPCGET](#): Get HTTP Resource
- [AT+HTTPCPOST](#): Post HTTP data of specified length
- [AT+HTTPCPUT](#): Put HTTP data of specified length
- [AT+HTTPURLCFG](#): Set/Get long HTTP URL
- [HTTP AT Error Codes](#)

3.6.1 AT+HTTPCLIENT: Send HTTP Client Request

Set Command

Command:

```
AT+HTTPCLIENT=<opt>,<content-type>,<"url">,[<"host">],[<"path">],<transport_type>[,
↪<"data">],[<"http_req_header">],[<"http_req_header">][...]
```

Response:

```
+HTTPCLIENT:<size>,<data>
```

```
OK
```

Parameters

- **<opt>**: method of HTTP client request.
 - 1: HEAD
 - 2: GET
 - 3: POST
 - 4: PUT
 - 5: DELETE
- **<content-type>**: data type of HTTP client request.
 - 0: application/x-www-form-urlencoded
 - 1: application/json
 - 2: multipart/form-data
 - 3: text/xml
- **<" url" >**: HTTP URL. The parameter can override the <host> and <path> parameters if they are null.
- **<" host" >**: domain name or IP address.
- **<" path" >**: HTTP Path.
- **<transport_type>**: HTTP Client transport type. Default: 1.
 - 1: HTTP_TRANSPORT_OVER_TCP
 - 2: HTTP_TRANSPORT_OVER_SSL
- **<" data" >**: If <opt> is a POST request, this parameter holds the data you send to the HTTP server. If not, this parameter does not exist, which means there is no need to input a comma to indicate this parameter.
- **<http_req_header>**: you can send more than one request header to the server.

Notes

- If the length of the entire command containing the URL exceeds 256 bytes, please use the [AT+HTTPURLCFG](#) command to preset the URL first, and then set the <"url"> parameter of this command to "".
- If the url parameter is not null, HTTP client will use it and ignore the host parameter and path parameter; If the url parameter is omitted or null string, HTTP client will use host parameter and path parameter.
- In some released firmware, HTTP client commands are not supported (see [ESP-AT Firmware Differences](#)), but you can enable it by `./build.py menuconfig>Component config>AT>AT http command support` and build the project (see [Compile ESP-AT Project](#)).

Example

```
// HEAD Request
AT+HTTPCLIENT=1,0,"http://httpbin.org/get","httpbin.org","/get",1

// GET Request
AT+HTTPCLIENT=2,0,"http://httpbin.org/get","httpbin.org","/get",1

// POST Request
AT+HTTPCLIENT=3,0,"http://httpbin.org/post","httpbin.org","/post",1,"field1=value1&
↪field2=value2"
```

3.6.2 AT+HTTPGETSIZE: Get HTTP Resource Size

Set Command

Command:

```
AT+HTTPGETSIZE=<"url">[,<tx size>][,<rx size>][,<timeout>]
```

Response:

```
+HTTPGETSIZE:<size>
```

```
OK
```

Parameters

- **<" url" >**: HTTP URL. It is a string parameter and should be enclosed with quotes.
- **<tx size>**: HTTP send buffer size. Unit: byte. Default: 2048. Range: [0,10240].
- **<rx size>**: HTTP receive buffer size. Unit: byte. Default: 2048. Range: [0,10240].
- **<timeout>**: Network timeout. Unit: millisecond. Default: 5000. Range: [0,180000].
- **<size>**: HTTP resource size.

Note

- If the length of the entire command containing the URL exceeds 256 bytes, please use the [AT+HTTPURLCFG](#) command to preset the URL first, and then set the `<"url">` parameter of this command to `" "`.
- In some released firmware, HTTP client commands are not supported (see [ESP-AT Firmware Differences](#)), but you can enable it by `./build.py menuconfig>Component config>AT>AT http command support` and build the project (see [Compile ESP-AT Project](#)).

Example

```
AT+HTTPGETSIZE="http://www.baidu.com/img/bdlogo.gif"
```

3.6.3 AT+HTTPCGET: Get HTTP Resource

Set Command

Command:

```
AT+HTTPCGET=<"url">[,<tx size>][,<rx size>][,<timeout>]
```

Response:

```
+HTTPCGET:<size>,<data>
OK
```

Parameters

- **<" url" >**: HTTP URL. It is a string parameter and should be enclosed with quotes.
- **<tx size>**: HTTP send buffer size. Unit: byte. Default: 2048. Range: [0,10240].
- **<rx size>**: HTTP receive buffer size. Unit: byte. Default: 2048. Range: [0,10240].
- **<timeout>**: Network timeout. Unit: millisecond. Default: 5000. Range: [0,180000].

Note

- If the length of the entire command containing the URL exceeds 256 bytes, please use the [AT+HTTPURLCFG](#) command to preset the URL first, and then set the `<"url">` parameter of this command to `" "`.

3.6.4 AT+HTTPCPOST: Post HTTP data of specified length

Set Command

Command:

```
AT+HTTPCPOST=<"url">,<length>[,<http_req_header_cnt>][,<http_req_header>..  
↪<http_req_header>]
```

Response:

```
OK  
  
>
```

The symbol > indicates that AT is ready for receiving serial data, and you can enter the data now. When the requirement of message length determined by the parameter <length> is met, the transmission starts.

If the transmission is successful, AT returns:

```
SEND OK
```

Otherwise, it returns:

```
SEND FAIL
```

Parameters

- <"url">: HTTP URL. It is a string parameter and should be enclosed with quotes.
- <length>: HTTP data length to POST. The maximum length is equal to the system allocable heap size.
- <http_req_header_cnt>: the number of <http_req_header> parameters.
- [<http_req_header>]: HTTP request header. You can send more than one request header to the server.

Note

- If the length of the entire command containing the URL exceeds 256 bytes, please use the [AT+HTTPURLCFG](#) command to preset the URL first, and then set the <"url"> parameter of this command to "".

3.6.5 AT+HTTPCPUT: Put HTTP data of specified length

Set Command

Command:

```
AT+HTTPCPUT=<"url">,<length>[,<http_req_header_cnt>][,<http_req_header>..  
↪<http_req_header>]
```

Response:

```
OK  
  
>
```

The symbol > indicates that AT is ready for receiving serial data, and you can enter the data now. When the requirement of message length determined by the parameter <length> is met, the transmission starts.

If the transmission is successful, AT returns:

SEND OK

Otherwise, it returns:

SEND FAIL

Parameters

- **<"url">**: HTTP URL. It is a string parameter and should be enclosed with quotes.
- **<length>**: HTTP data length to PUT. The maximum length is equal to the system allocable heap size.
- **<http_req_header_cnt>**: the number of **<http_req_header>** parameters.
- **[<http_req_header>]**: HTTP request header. You can send more than one request header to the server.

Note

- If the length of the entire command containing the URL exceeds 256 bytes, please use the [AT+HTTPURLCFG](#) command to preset the URL first, and then set the **<"url">** parameter of this command to "".

3.6.6 AT+HTTPURLCFG: Set/Get long HTTP URL

Query Command

Command:

AT+HTTPURLCFG?

Response:

[+HTTPURLCFG:<url length>,<data>]
OK

Set Command

Command:

AT+HTTPURLCFG=<url length>

Response:

OK

>

This response indicates that AT is ready for receiving serial data. You should enter the URL now, and when the URL length reaches the **<url length>** value, the system returns:

SET OK

Parameters

- **<url length>**: HTTP URL length. Unit: byte.
 - 0: clean the HTTP URL configuration.
 - [8,8192]: set the HTTP URL configuration.
- **<data>**: HTTP URL data.

3.6.7 HTTP AT Error Codes

- HTTP Client:

HTTP Client Error Code	Description
0x7000	Failed to Establish Connection
0x7190	Bad Request
0x7191	Unauthorized
0x7192	Payment Required
0x7193	Forbidden
0x7194	Not Found
0x7195	Method Not Allowed
0x7196	Not Acceptable
0x7197	Proxy Authentication Required
0x7198	Request Timeout
0x7199	Conflict
0x719a	Gone
0x719b	Length Required
0x719c	Precondition Failed
0x719d	Request Entity Too Large
0x719e	Request-URI Too Long
0x719f	Unsupported Media Type
0x71a0	Requested Range Not Satisfiable
0x71a1	Expectation Failed

- HTTP Server:

HTTP Server Error Code	Description
0x71f4	Internal Server Error
0x71f5	Not Implemented
0x71f6	Bad Gateway
0x71f7	Service Unavailable
0x71f8	Gateway Timeout
0x71f9	HTTP Version Not Supported

- HTTP AT:
 - The error code of command AT+HTTPCLIENT will be 0x7000+Standard HTTP Error Code (For more details about Standard HTTP/1.1 Error Code, see [RFC 2616](#)).
 - For example, if AT gets the HTTP error 404 when calling command AT+HTTPCLIENT, it will respond with error code of 0x7194 (hex (0x7000+404)=0x7194).

3.7 Signaling Test AT Commands

- **AT+FACTPLCP**: Send with long or short PLCP (Physical Layer Convergence Procedure)

3.7.1 AT+FACTPLCP: Send with Long or Short PLCP

Set Command

Command:

```
AT+FACTPLCP=<enable>,<tx_with_long>
```

Response:

OK

Parameters

- **<enable>**: Enable or disable manual configuration.
 - 0: Disable manual configuration. The default value for the parameter `<tx_with_long>` will be used.
 - 1: Enable manual configuration. The type of PLCP that AT sends depends on `<tx_with_long>`.
- **<tx_with_long>**: Send with long PLCP or short PLCP.
 - 0: Send with short PLCP (default).
 - 1: Send with long PLCP.

3.8 Web Server AT Commands

- **AT+WEBSERVER**: Enable/disable Wi-Fi connection configuration via Web server.

3.8.1 AT+WEBSERVER: Enable/disable Wi-Fi connection configuration via Web server

Set Command

Command:

AT+WEBSERVER=<enable>,<server_port>,<connection_timeout>

Response:

OK

Parameters

- **<enable>**: Enable or disable Web server.
 - 0: Disable the Web server and release related resources.
 - 1: Enable Web server, which means that you can use WeChat or a browser to configure Wi-Fi connection information.
- **<server_port>**: The Web server port number.
- **<connection_timeout>**: The timeout for the every connection. Unit: second. Range:[21,60].

Notes

- There are two ways to provide the HTML files needed by the Web server. One is to use FAT file system, and you need to enable AT FS command at this time. The other one is to use embedded files to store HTML files (default setting).
- Please make sure that the maximum number of open sockets is not less than 12, you may change the number by `./build.py menuconfig>Component config>LWIP>Max bumber of open sockets` and compile the project (see [Compile ESP-AT Project](#)).
- The default firmware does not support Web server AT commands (see [ESP-AT Firmware Differences](#)), but you can enable it by `./build.py menuconfig>Component config>AT>AT WEB Server command support` and compile the project (see [Compile ESP-AT Project](#)).
- ESP-AT supports captive portals in ESP32-C2 series of devices. See [example](#).
- For more examples, please refer to [Web Server AT Example](#).
- The command implementation is open-source. See the source code in [at/src/at_web_server_cmd.c](#).
- Please refer to [How to Implement OTA Upgrade](#) for more OTA commands.

Example

```
// Enable the Web server with port 80, and the timeout for the every connection is 50 seconds
↪50 seconds
AT+WEBSERVER=1,80,50

// Disable the Web server
AT+WEBSERVER=0
```

3.9 Driver AT Commands

- *AT+DRVADC*: Read ADC channel value.
- *AT+DRVPWMINIT*: Initialize PWM driver.
- *AT+DRVPWMDUTY*: Set PWM duty.
- *AT+DRVPWMFADE*: Set PWM fade.
- *AT+DRV2CINIT*: Initialize I2C master driver.
- *AT+DRV2CRD*: Read I2C data.
- *AT+DRV2CWRDATA*: Write I2C data.
- *AT+DRV2CWRBYTES*: Write no more than 4 bytes I2C data.
- *AT+DRVSPICONFGPIO*: Configure SPI GPIO.
- *AT+DRVSPIINIT*: Initialize SPI master driver.
- *AT+DRVSPIRD*: Read SPI data.
- *AT+DRVSPIWR*: Write SPI data.

3.9.1 AT+DRVADC: Read ADC Channel Value

Set Command**Command:**

```
AT+DRVADC=<channel>,<atten>
```

Response:

```
+DRVADC:<raw data>
```

```
OK
```

Parameters

- **<channel>**: ADC1 channel.
- For ESP32-C2 devices, the range is [0,4].

CHANNEL	GPIO
0	GPIO0
1	GPIO1
2	GPIO2
3	GPIO3
4	GPIO4

- **<atten>**: attenuation.
- 0: 0 dB attenuation, effective measurement range is [0, 750] mV.

- 1: 2.5 dB attenuation, effective measurement range is [0, 1050] mV.
- 2: 6 dB attenuation, effective measurement range is [0, 1300] mV.
- 3: 11 dB attenuation, effective measurement range is [0, 2500] mV.
- **<raw data>**: ADC channel value.

Notes

- ESP-AT only supports ADC1.
- ESP32-C2 support 12-bit width.
- For details on how to convert the channel value into voltage, please refer to [ADC Conversion](#).

Example

```
// For ESP32-C2, 0 dB attenuation, effective measurement range is [0, 750] mV
// The returned 2048 means the voltage is 2048 / 4095 * 750 = 375.09 mV
AT+DRVADC=0,0
+DRVADC:2048

OK
```

3.9.2 AT+DRVPWMINIT: Initialize PWM Driver

Set Command

Command:

```
AT+DRVPWMINIT=<freq>,<duty_res>,<ch0_gpio>[,...,<ch3_gpio>]
```

Response:

```
OK
```

Parameters

- **<freq>**: LEDC timer frequency. Unit: Hz. Range: 1 Hz ~ 8 MHz.
- **<duty_res>**: LEDC channel duty resolution. Range: 0 ~ 20 bits.
- **<chx_gpio>**: LEDC output GPIO number of channel x. For example, if you want to use GPIO16 as channel 0, set <ch0_gpio> to 16.

Notes

- AT can support a maximum of 4 channels.
- The number of channels that you initialize using this command will determine how many channels you can set using other PWM commands, including [AT+DRVPWMDUTY](#) and [AT+DRVPWMFADE](#). For example, if you initialize two channels, you can only change the two channels' PWM duty using command [AT+DRVPWMDUTY](#).
- The frequency and the duty resolution are interdependent. See [Supported Range of Frequency and Duty Resolutions](#) for more details.

Example

```
AT+DRVPWMINIT=5000,13,17,16,18,19 // set 4 channels; frequency: 5 kHz; duty_
↪resolution: 13 bits
AT+DRVPWMINIT=10000,10,17 // only use channel 0, frequency: 10 kHz; duty_
↪resolution: 10 bits; other PMW commands can only set one channel
```

3.9.3 AT+DRVPWMDUTY: Set PWM Duty

Set Command

Command:

```
AT+DRVPWMDUTY=<ch0_duty>[, ..., <ch3_duty>]
```

Response:

```
OK
```

Parameter

- **<duty>**: LEDC channel duty. Range: $[0, 2^{\text{duty_resolution}}]$.

Notes

- AT can support a maximum of 4 channels.
- If you do not want to set **<duty>** for a specific channel, just omit it.

Example

```
AT+DRVPWMDUTY=255,512 // set channel 0 to duty 255, set channel 1 to duty 512
AT+DRVPWMDUTY=,,0 // set channel 2 to duty 0
```

3.9.4 AT+DRVPWMFADE: Set PWM Fade

Set Command

Command:

```
AT+DRVPWMFADE=<ch0_target_duty>,<ch0_fade_time>[, ..., <ch3_target_duty>,<ch3_fade_
↪time>]
```

Response:

```
OK
```

Parameters

- **<target_duty>**: target duty of fading. Range: $[0, 2^{\text{duty_resolution}-1}]$.
- **<fade_time>**: the maximum time of fading. Unit: millisecond.

Notes

- AT can support a maximum of 4 channels.
- If you do not want to set <target_duty> and <fade_time> for a specific channel, just omit them.

Example

```
AT+DRVPWMFADE=,,0,1000 // use one second to change channel 1 duty to 0
AT+DRVPWMFADE=1024,1000,0,2000, // use one second time to change channel 0 duty_
↪to 1024, two seconds to change channel 1 duty to 0
```

3.9.5 AT+DRVI2CINIT: Initialize I2C Master Driver**Set Command****Command:**

```
AT+DRVI2CINIT=<num>,<scl_io>,<sda_io>,<clock>
```

Response:

```
OK
```

Parameters

- <num>: I2C port number. Range: 0 ~ 1. If the following parameters are not set, AT will deinitialize the I2C port.
- <scl_io>: GPIO number for I2C SCL signal.
- <sda_io>: GPIO number for I2C SDA signal.
- <clock>: I2C clock frequency for master mode. Unit: Hz. Maximum: 1 MHz.

Note

- This command only supports I2C masters.

Example

```
AT+DRVI2CINIT=0,25,26,1000 // initialize I2C0; GPIO25 is SCL; GPIO26 is SDA; I2C_
↪clock is 1 kHz
AT+DRVI2CINIT=0 // deinitialize I2C0
```

3.9.6 AT+DRVI2CRD: Read I2C Data**Set Command****Command:**

```
AT+DRVI2CRD=<num>,<address>,<length>
```

Response:

```
+DRVI2CRD:<read data>
OK
```

Parameters

- **<num>**: I2C port number. Range: 0 ~ 1.
- **<address>**: I2C slave device address.
 - 7-bit address: 0 ~ 0x7F.
 - 10-bit address: The first seven bits of the first byte are the combination 1111 0XX of which the last two bits (XX) are the two Most Significant Bits (MSBs) of the 10-bit address. For example, if the 10-bit address is 0x2FF (b' 101111111), the input address should be 0x7AFF (b' 11110101111111).
- **<length>**: I2C data length. Range: 1 ~ 2048.
- **<read data>**: I2C data.

Note

- I2C transmission timeout is one second.

Example

```
AT+DRVI2CRD=0,0x34,1      // I2C0 reads one byte data from address 0x34
AT+DRVI2CRD=0,0x7AFF,1    // I2C0 reads one byte data from 10-bit address 0x2FF

// I2C0 reads address 0x34, register address 0x27, read 2 bytes
AT+DRVI2CWRBYTES=0,0x34,1,0x27  // I2C0 first writes device address 0x34,
↔register address 0x27
AT+DRVI2CRD=0,0x34,2        // I2C0 reads 2 bytes
```

3.9.7 AT+DRVI2CWRDATA: Write I2C Data

Set Command

Command:

```
AT+DRVI2CWRDATA=<num>,<address>,<length>
```

Response:

```
OK
>
```

This response indicates that you should enter the data you want to write. When the requirement of data length is met, the data transmission starts.

If the data is transmitted successfully, AT returns:

```
OK
```

If the data transmission fails, AT returns:

```
ERROR
```

Parameters

- **<num>**: I2C port number. Range: 0 ~ 1.
- **<address>**: I2C slave device address.
 - 7-bit address: 0 ~ 0x7F.
 - 10-bit address: The first seven bits of the first byte are the combination 1111 0XX of which the last two bits (XX) are the two Most Significant Bits (MSBs) of the 10-bit address. For example, if the 10-bit address is 0x2FF (b' 101111111), the input address should be 0x7AFF (b' 11110101111111).
- **<length>**: I2C data length. Range: 1 ~ 2048.

Note

- I2C transmission timeout is one second.

Example

```
AT+DRVI2CWRDATA=0,0x34,10 // I2C0 writes 10 bytes data to address 0x34
```

3.9.8 AT+DRVI2CWRBYTES: Write No More Than 4 Bytes I2C Data

Set Command

Command:

```
AT+DRVI2CWRBYTES=<num>,<address>,<length>,<data>
```

Response:

```
OK
```

Parameters

- **<num>**: I2C port number. Range: 0 ~ 1.
- **<address>**: I2C slave device address.
 - 7-bit address: 0 ~ 0x7F.
 - 10-bit address: The first seven bits of the first byte are the combination 1111 0XX of which the last two bits (XX) are the two Most Significant Bits (MSBs) of the 10-bit address. For example, if the 10-bit address is 0x2FF (b' 101111111), the input address should be 0x7AFF (b' 11110101111111).
- **<length>**: the length of the I2C data you want to write. Range: 1 ~ 4 bytes.
- **<data>**: the data of <length> long. Range: 0 ~ 0xFFFFFFFF.

Note

- I2C transmission timeout is one second.

Example

```
AT+DRVI2CWRBYTES=0,0x34,2,0x1234 // I2C0 writes 2 bytes data 0x1234 to address_
↪0x34
AT+DRVI2CWRBYTES=0,0x7AFF,2,0x1234 // I2C0 writes 2 bytes data 0x1234 to 10-bit_
↪address 0x2FF
```

(continues on next page)

(continued from previous page)

```
// I2C0 writes address 0x34; register address: 0x27; data: c0xFF
AT+DRVI2CWRBYTES=0,0x34,2,0x27FF
```

3.9.9 AT+DRVSPICONFGPIO: Configure SPI GPIO

Set Command

Command:

```
AT+DRVSPICONFGPIO=<mosi>,<miso>,<sclk>,<cs>
```

Response:

```
OK
```

Parameters

- **<mosi>**: GPIO pin for Master Out Slave In signal.
- **<miso>**: GPIO pin for Master In Slave Out signal, or -1 if not used.
- **<sclk>**: GPIO pin for SPI Clock signal.
- **<cs>**: GPIO pin for slave selection signal, or -1 if not used.

3.9.10 AT+DRVSPIINIT: Initialize SPI Master Driver

Set Command

Command:

```
AT+DRVSPIINIT=<clock>,<mode>,<cmd_bit>,<addr_bit>,<dma_chan>[,bits_msb]
```

Response:

```
OK
```

Parameters

- **<clock>**: Clock speed, divisors of 80 MHz. Unit: Hz. Maximum: 40 MHz.
- **<mode>**: SPI mode. Range: 0 ~ 3.
- **<cmd_bit>**: Default amount of bits in command phase. Range: 0 ~ 16.
- **<addr_bit>**: Default amount of bits in address phase. Range: 0 ~ 64.
- **<dma_chan>**: Either channel 1 or 2, or 0 in the case when no DMA is required.
- **<bits_msb>**: SPI data format:
 - Bit0:
 - * 0: Transmit MSB first (default).
 - * 1: Transmit LSB first.
 - Bit1:
 - * 0: Receive data MSB first (default).
 - * 1: Receive data LSB first.

Note

- You should configure SPI GPIO before SPI initialization.

Example

```
AT+DRVSPIINIT=102400,0,0,0,0,3 // SPI clock: 100 kHz; mode: 0; both command and
↪address bits are 0; not use DMA; transmit and receive LSB first
OK
AT+DRVSPIINIT=0 // delete SPI Driver
OK
```

3.9.11 AT+DRVSPIRD: Read SPI Data

Set Command

Command:

```
AT+DRVSPIRD=<data_len>[,<cmd>,<cmd_len>][,<addr>,<addr_len>]
```

Response:

```
+DRVSPIRD:<read data>
OK
```

Parameters

- **<data_len>**: length of SPI data you want to read. Range: 1 ~ 4092 bytes.
- **<cmd>**: command data. The length of the data is set in **<cmd_len>**.
- **<cmd_len>**: command length in this transaction. Range: 0 ~ 2 bytes.
- **<addr>**: command address. The length of the address is set in **<addr_len>**.
- **<addr_len>**: The address length in this transaction. Range: 0 ~ 4 bytes.

Note

- If you don't use DMA, the maximum **<data_len>** you can set is 64 bytes each time.

Example

```
AT+DRVSPIRD=2 // read 2 bytes data
+DRVI2CREAD:ffff
OK

AT+DRVSPIRD=2,0x03,1,0x001000,3 // read 2 bytes data; <cmd> is 0x03; <cmd_len> is
↪1 byte; <addr> is 0x1000; <addr_len> is 3 bytes
+DRVI2CREAD:ffff
OK
```

3.9.12 AT+DRVSPIWR: Write SPI Data

Set Command

Command:

```
AT+DRVSPIWR=<data_len>[,<cmd>,<cmd_len>][,<addr>,<addr_len>]
```

Response:

When `<data_len>` is larger than 0, AT returns:

```
OK
>
```

This response indicates that you should enter the data you want to write. When the requirement of data length is met, the data transmission starts.

If the data is transmitted successfully, AT returns:

```
OK
```

When `<data_len>` is equal to 0, which means AT transmits commands and addresses only, and no SPI data, AT returns:

```
OK
```

Parameters

- **`<data_len>`**: SPI data length. Range: 0 ~ 4092.
- **`<cmd>`**: command data. The length of the data is set in `<cmd_len>`.
- **`<cmd_len>`**: command length in this transaction. Range: 0 ~ 2 bytes.
- **`<addr>`**: command address. The length of the address is set in `<addr_len>`.
- **`<addr_len>`**: The address length in this transaction. Range: 0 ~ 4 bytes.

Note

- If you don't use DMA, the maximum `<data_len>` you can set is 64 bytes each time.

Example

```
AT+DRVSPIWR=2 // write 2 bytes data
OK
> // begin receiving serial data
OK

AT+DRVSPIWR=0,0x03,1,0x001000,3 // write 0 byte data; <cmd> is 0x03; <cmd_len> is
↪1 byte; <addr> is 0x1000; <addr_len> is 3 bytes
OK
```

3.10 User AT Commands

- **`AT+USERRAM`**: Operate user's free RAM.
- **`AT+USEROTA`**: Upgrade the firmware according to the specified URL.
- **`AT+USERWKMCCCFG`**: Configure how AT wakes up MCU.
- **`AT+USERMCUSLEEP`**: MCU indicates its sleep state.
- **`AT+USERDOCS`**: Query the ESP-AT user guide for current firmware.

3.10.1 AT+USERRAM: Operate user' s free RAM

Query Command

Function:

Query the current available user' s RAM size.

Command:

```
AT+USERRAM?
```

Response:

```
+USERRAM:<size>
OK
```

Set Command

Function:

Operate user' s free RAM

Command:

```
AT+USERRAM=<operation>,<size>[,<offset>]
```

Response:

```
+USERRAM:<length>,<data>    // esp-at returns this response only when the operator
↪is ``read``
OK
```

Parameters

- **<operation>**:
 - 0: release user' s RAM
 - 1: malloc user' s RAM
 - 2: write user' s RAM
 - 3: read user' s RAM
 - 4: clear user' s RAM
- **<size>**: the size to malloc/read/write
- **<offset>**: the offset to read/write. Default: 0

Notes

- Please malloc the RAM size before you perform any other operations.
- If the operator is `write`, wrap return `>` after the write command, then you can send the data that you want to write. The length should be parameter `<length>`.
- If the operator is `read` and the length is bigger than 1024, ESP-AT will reply multiple times in the same format, each reply can carry up to 1024 bytes of data, and eventually end up with `\r\nOK\r\n`.

Example

```
// malloc 1 KB user's RAM
AT+USERAM=1,1024

// write 500 bytes to RAM (offset: 0)
AT+USERAM=2,500

// read 64 bytes from RAM offset 100
AT+USERAM=3,64,100

// free the user's RAM
AT+USERAM=0
```

3.10.2 AT+USEROTA: Upgrade the Firmware According to the Specified URL

ESP-AT upgrades firmware at runtime by downloading the new firmware from a specific URL.

Set Command

Function:

Upgrade to the firmware version specified by the URL.

Command:

```
AT+USEROTA=<url len>
```

Response:

```
OK
>
```

This response indicates that AT is ready for receiving URL. You should enter the URL, and when the URL length reaches the <url len> value, the system returns:

```
Recv <url len> bytes
```

After AT outputs the above information, the upgrade process starts. If the upgrade process is complete, the system return:

```
OK
```

If the parameter is wrong or firmware upgrades fails, the system returns:

```
ERROR
```

Parameters

- <url len>: URL length. Maximum: 8192 bytes.

Note

- You can [Download AT firmware from GitHub Actions](#), or you can generate AT firmware from [Compile ESP-AT Project](#) as well.
- If you use ESP32C2-2MB module config, OTA firmware is build/custom_ota_binaries/esp-at.bin.xz.packed. If you use ESP32C2-4MB module config, OTA firmware is build/esp-at.bin.

- The speed of the upgrade depends on the network status.
- If the upgrade fails due to unfavorable network conditions, AT will return `ERROR`. Please wait for some time before retrying.
- After you upgrade the AT firmware, you are suggested to call the command `AT+RESTORE` to restore the factory default settings.
- `AT+USEROTA` supports `HTTP` and `HTTPS`.
- After AT outputs the `>` character, the special characters in the URL does not need to be escaped through the escape character, and it does not need to end with a new line(CR-LF).
- When the URL is `HTTPS`, SSL verification is not recommended. If SSL verification is required, you need to generate your own PKI files and download them into the corresponding partition, and then load the certificates in the code implemented by the `AT+USEROTA` command. Please refer to [How to Generate PKI Files](#) for PKI files. For `AT+USEROTA` command, ESP-AT project provides an example of `USEROTA`.
- Please refer to [How to Implement OTA Upgrade](#) for more OTA commands.

Example

```
AT+USEROTA=36

OK

>
Recv 36 bytes

OK
```

3.10.3 AT+USERWKMUCCFG: Configure How AT Wakes Up MCU

Set Command

Function:

This command configures how AT checks whether MCU is in awake state and how to wake it up.

- If MCU is in awake state, AT will directly send the data to it without waking it up.
- If MCU is in sleep state and AT is ready to actively send the data to MCU (the data sent actively is same to [ESP-AT Message Reports](#)), AT will send wake signals to wake it up first and then send the data to it. Wake signals will be cleared after MCU is waked up or timeout.

Command:

```
AT+USERWKMUCCFG=<enable>,<wake mode>,<wake number>,<wake signal>,<delay time>[,  
↪<check mcu awake method>]
```

Response:

```
OK
```

Parameters

- **<enable>**: Enable or disable wake-up configuration.
 - 0: Disable wake-up configuration
 - 1: Enable wake-up configuration
- **<wake mode>**: wake mode.
 - 1: GPIO wake-up
 - 2: UART wake-up
- **<wake number>**: It means differently depending on the parameter `<wake mode>`.

- If <wake mode> is 1, <wake number> represents GPIO number for wake-up. You need to ensure that the configured GPIO wake-up pin is not used for other purposes. Otherwise, you need to perform compatibility processing.
- If <wake mode> is 2, <wake number> represents UART number. Currently, only 1 is supported for <wake number>, which means only UART1 can wake up MCU.
- **<wake signal>**: It means differently depending on the parameter <wake mode>.
 - If <wake mode> is 1, <wake signal> represents wake-up level.
 - * 0: low level
 - * 1: high level
 - If <wake mode> is 2, <wake signal> represents wake-up byte. Range: [0,255].
- **<delay time>**: Maximum waiting time. Unit: milliseconds. Range: [0,60000]. It means differently depending on the parameter <wake mode>.
 - If <wake mode> is 1, the <wake signal> level will be held on during the <delay time>. After the <delay time> is reached, the <wake signal> level is reversed.
 - If <wake mode> is 2, AT will send <wake signal> byte immediately and wait until timeout.
- **<check mcu awake method>**: AT checks whether MCU is in awake state.
 - Bit 0: Whether to enable *AT+USERMCUSLEEP* command linkage. Enabled by default. That is, when receiving AT+USERMCUSLEEP=0 command from MCU, AT knows that MCU is in awake state; when receiving AT+USERMCUSLEEP=1 command, AT knows that MCU is in sleep.
 - Bit 1: Whether to enable AT+SLEEP command linkage. Disabled by default. That is, when receiving AT+SLEEP=0 command, AT knows that MCU is in awake state; when receiving *AT+SLEEP=1/2/3* command, AT knows that MCU is in sleep.
 - Bit 2: Whether to enable the function of indicating MCU state after <delay time> timeout. Disabled by default. That is, when disabled, it indicates that MCU is in sleep after <delay time>; when enabled, it indicates that MCU is in awake state after <delay time>.
 - Bit 3 (not implemented yet): Whether to enable the function of indicating MCU state via GPIO. Unsupported by default.

Notes

- This command needs to be configured only once.
- Each time before the AT actively sends data to MCU, it will send a wake-up signal first and then enter the waiting time. When <delay time> is reached, it will directly send data. This wait timeout will reduce the transmission efficiency with MCU.
- If AT receives any wake-up event in <check mcu wake method> before <delay time>, it will immediately clear the wake-up state; otherwise, the wake-up state will be cleared automatically after the <delay time> timeout.

Example

```
// Enable wake-up MCU configuration. Before each time the AT sends data to the MCU,
↪ it will first use the GPIO18 pin of the Wi-Fi module to wake up the MCU at a
↪ high level and hold on the high level for 10 seconds.
AT+USERWKMUCCFG=1,1,18,1,10000,3

// Enable wake-up configuration
AT+USERWKMUCCFG=0
```

3.10.4 AT+USERMCUSLEEP: MCU Indicates Its Sleep State

Set Command

Function:

This command can only be taken effect when the <check mcu wake method> Bit 0 of the *AT+USERWKMUCCFG* command is configured. It used to inform AT that the current MCU sleep state.

Command:

```
AT+USERMCUSLEEP=<state>
```

Response:

```
OK
```

Parameters

- **<state>**:
 - 0: Indicates that MCU is in awake state.
 - 1: Indicates that MCU is in sleep state.

Example

```
// MCU tells AT that the current MCU is in awake state
AT+USERMCUSLEEP=0
```

3.10.5 AT+USERDOCS: Query the ESP-AT User Guide for Current Firmware

Query Command**Function:**

Query the ESP-AT English and Chinese user guide for current running firmware.

Command:

```
AT+USERDOCS?
```

Response:

```
+USERDOCS:<"en url">
+USERDOCS:<"cn url">

OK
```

Parameters

- **<" en url" >**: the URL for English document
- **<" cn url" >**: the URL for Chinese document

Example

```
AT+USERDOCS?
+USERDOCS:"https://docs.espressif.com/projects/esp-at/en/latest/esp32c2/index.html"
+USERDOCS:"https://docs.espressif.com/projects/esp-at/zh_CN/latest/esp32c2/index.
↪html"

OK
```

It is strongly recommended to read the following sections for some common information on AT commands before you dive into the details of each command.

- [AT Command Types](#)
- [AT Commands with Configuration Saved in the Flash](#)
- [AT Messages](#)

3.11 AT Command Types

Generic AT command has four types:

Type	Command Format	Description
Test Command	AT+<CommandName>	Query the Set Commands' internal parameters and their range of values.
Query Command	AT+<CommandName>=?	Return the current value of parameters.
Set Command	AT+<CommandName>=<...>	Set the value of user-defined parameters in commands, and run these commands.
Execute Command	AT+<CommandName>	Run commands with no user-defined parameters.

- Not all AT commands support all of the four types mentioned above.
- Currently, only strings and integer numbers are supported as input parameters in AT commands.
- Angle brackets < > designate parameters that can not be omitted.
- Square brackets [] designate optional parameters that can be omitted. The default value of the parameter will be used instead when you omit it. Below are examples of entering the command [AT+CWJAP](#) with some parameters omitted.

```
AT+CWJAP="ssid","password"
AT+CWJAP="ssid","password","11:22:33:44:55:66"
```

- If the parameter you want to omit is followed by a parameter(s), you must give a , to indicate it.

```
AT+CWJAP="ssid","password",,1
```

- String values need to be included in double quotation marks.

```
AT+CWSAP="ESP756290","21030826",1,4
```

- Escape character syntax is needed if a string contains special characters, such as , , " , or \ :
 - \\ : escape the backslash itself
 - \, : escape comma which is not used to separate each parameter
 - \": escape double quotation mark which is not used to mark string input
 - \<any>: escape <any> character means that drop backslash symbol and only use <any> character
- Escape is needed in AT commands only, not elsewhere. For example, when AT command port prints > and wait for your input, the input does not need to be escaped.

```
AT+CWJAP="comma\,backslash\\ssid","1234567890"
AT+MQTTPUB=0,"topic","\"{\"sensor\":012}\"",1,0
```

- The default baud rate of AT command is 115200.
- The length of each AT command should be no more than 256 bytes.
- AT commands end with a new-line (CR-LF), so the serial tool should be set to “New Line Mode” .
- Definitions of AT command error codes are provided in [AT API Reference](#):
 - [esp_at_error_code](#)
 - [esp_at_para_parse_result_type](#)
 - [esp_at_result_code_string_index](#)

3.12 AT Commands with Configuration Saved in the Flash

Configuration settings entered by the following AT Commands will always be saved in the flash NVS Area, so they can be automatically restored on reset:

- **AT+UART_DEF**: AT+UART_DEF=115200,8,1,0,3
- **AT+SAVETRANSLINK**: AT+SAVETRANSLINK=1,"192.168.6.10",1001
- **AT+CWAUTOCONN**: AT+CWAUTOCONN=1

Saving of configuration settings by several other commands can be switched on or off with **AT+SYSTORE** command, which is mentioned in the Note section of these commands.

Note: The parameters of AT commands are saved based on **NVS** library. Therefore, if the command is configured with the same parameter value, flash will not be written; If the command is configured with the different parameter value, flash will not be erased frequently.

3.13 AT Messages

There are two types of ESP-AT messages returned from the ESP-AT command port:

- **ESP-AT Response Messages (passive)**
Each ESP-AT command input returns response messages to tell the sender the result of the ESP-AT command. The last message in the response is either OK or ERROR.

Table 4: ESP-AT Response Messages

AT Response Messages	Description
OK	AT command process done and return OK
ERROR	AT command error or error occurred during the execution
SEND OK	Data has been sent to the protocol stack (specific to AT+CIPSEND and AT+CIPSENDEX command). It doesn't mean that the data has been sent to the opposite end
SEND FAIL	Error occurred during sending the data to the protocol stack (specific to AT+CIPSEND and AT+CIPSENDEX command)
SET OK	The URL has been set successfully (specific to AT+HTTPURLCFG command)
+<Command Name>: . . .	Response to the sender that describes AT command process results in details

- **ESP-AT Message Reports (active)**
ESP-AT will report important state changes or messages in the system.

Table 5: ESP-AT Message Reports

ESP-AT Message Report	Description
ready	The ESP-AT firmware is ready
busy p...	Busy processing. The system is in process of handling the previous command, thus CANNOT accept the new input
ERR CODE:<0x%08x>	Error code for different commands
Will force to restart!!!	Module restart right now
smartconfig type:<xxx>	Smartconfig type
Smart get wifi info	Smartconfig has got the SSID and PASSWORD information
+SCRD:<length>,"<reserved data>"	ESP-Touch v2 has got the reserved information
smartconfig connected wifi	Smartconfig done. ESP-AT has connected to the Wi-Fi

continues on next page

Table 5 – continued from previous page

ESP-AT Message Report	Description
WIFI CONNECTED	Wi-Fi station interface has connected to an AP
WIFI GOT IP	Wi-Fi station interface has got the IPv4 address
WIFI GOT IPv6 LL	Wi-Fi station interface has got the IPv6 LinkLocal address
WIFI GOT IPv6 GL	Wi-Fi station interface has got the IPv6 Global address
WIFI DISCONNECT	Wi-Fi station interface has disconnected from an AP
+ETH_CONNECTED	Ethernet interface has connected
+ETH_GOT_IP	Ethernet interface has got the IPv4 address
+ETH_DISCONNECTED	Ethernet interface has disconnected
[<conn_id>],CONNECT	A network connection of which ID is <conn_id> is established (ID=0 by default)
[<conn_id>],CLOSED	A network connection of which ID is <conn_id> ends (ID=0 by default)
+LINK_CONN	Detailed connection information of TCP/UDP/SSL
+STA_CONNECTED: <sta_mac>	A station has connected to the Wi-Fi softAP interface of ESP-AT
+DIST_STA_IP: <sta_mac>,<sta_ip>	The Wi-Fi softAP interface of ESP-AT distributes an IP address to the station
+STA_DISCONNECTED: <sta_mac>	A station disconnected from the Wi-Fi softAP interface of ESP-AT
>	ESP-AT is waiting for more data to be received
Recv <xxx> bytes	ESP-AT has already received <xxx> bytes from the ESP-AT command port
+IPD	ESP-AT received the data from the network when AT is not in <i>Passthrough Mode</i>
The Data in <i>Passthrough Mode</i>	ESP-AT received the data from the network or Bluetooth when AT is in <i>Passthrough Mode</i>
SEND Canceled	Cancel to send in <i>Wi-Fi normal sending mode</i>
Have <xxx> Connections	Has reached the maximum connection counts for server
+QUIT	ESP-AT quits from the Wi-Fi <i>Passthrough Mode</i>
NO CERT FOUND	No valid device certificate found in custom partition
NO PRVT_KEY FOUND	No valid private key found in custom partition
NO CA FOUND	No valid CA certificate found in custom partition
+MQTTCONNECTED	MQTT connected to the broker
+MQTTDISCONNECTED	MQTT disconnected from the broker
+MQTTSUBRECV	MQTT received the data from the broker
+MQTTPUB:FAIL	MQTT failed to publish data
+MQTTPUB:OK	MQTT publish data done
+BLECONN	A Bluetooth LE connection established
+BLEDISCONN	A Bluetooth LE connection ends
+READ	A read operation from Bluetooth LE connection
+WRITE	A write operation from Bluetooth LE connection
+NOTIFY	A notification from Bluetooth LE connection
+INDICATE	An indication from Bluetooth LE connection
+BLESECNTFYKEY	Bluetooth LE SMP key
+BLESECREQ:<conn_index>	Received encryption request which index is <conn_index>
+BLEAUTHCMPL:<conn_index>,<enc_result>	Bluetooth LE SMP pairing completed
+BLUFIDATA:<len>,<data>	The ESP device received customized data from the phone over BluFi

Chapter 4

AT Command Examples

4.1 TCP/IP AT Examples

This document provides detailed command examples to illustrate how to utilize *TCP/IP AT Commands* on ESP32-C2.

- *ESP32-C2 as a TCP client in single connection*
- *ESP32-C2 as a TCP server in multiple connections*
- *UDP transmission with fixed remote IP address and port*
- *UDP transmission with changeable remote IP address and port*
- *ESP32-C2 as an SSL client in single connection*
- *ESP32-C2 as an SSL server in multiple connections*
- *ESP32-C2 as an SSL client to create a single connection with mutual authentication*
- *ESP32-C2 as an SSL server to create multiple connections with mutual authentication*
- *UART Wi-Fi passthrough transmission when the ESP32-C2 works as a TCP client in single connection*
- *UART Wi-Fi passthrough transmission when the ESP32-C2 works as a TCP server*
- *UART Wi-Fi passthrough transmission when the ESP32-C2 works as a softAP in UDP transparent transmission*

4.1.1 ESP32-C2 as a TCP client in single connection

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.

Command:

```
AT+CWJAP="espressif", "1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Query the device's IP address.

Command:

```
AT+CIPSTA?
```

Response:

```
+CIPSTA:ip:"192.168.3.112"
+CIPSTA:gateway:"192.168.3.1"
+CIPSTA:netmask:"255.255.255.0"

OK
```

Note:

- The query results you obtained may be different from those in the above response.

4. Connect the PC to the same router which ESP32-C2 is connected to.

Use a network tool on the PC to create a TCP server. For example, the TCP server on PC is 192.168.3.102, and the port is 8080.

5. ESP32-C2 is connected to the TCP server as a client over TCP. The server's IP address is 192.168.3.102, and the port is 8080.

Command:

```
AT+CIPSTART="TCP", "192.168.3.102", 8080
```

Response:

```
CONNECT

OK
```

6. Send 4 bytes of data.

Command:

```
AT+CIPSEND=4
```

Response:

```
OK

>
```

Input 4 bytes, for example, `test`, then AT will respond the following message.

```
Recv 4 bytes

SEND OK
```

Note:

- If the number of bytes inputted are more than the length (n) set by AT+CIPSEND, the system will reply `busy p...`, and send the first n bytes. And after sending the first n bytes, the system will reply `SEND OK`.

7. Receive 4 bytes of data.

Assume that the TCP server sends 4 bytes of data (data is `test`), the system will prompt:

```
+IPD,4:test
```

4.1.2 ESP32-C2 as a TCP server in multiple connections

When ESP32-C2 works as a TCP server, multiple connections should be enabled by `AT+CIPMUX=1` command, because in most cases more than one client needs to be connected to the ESP32-C2 server.

Below is an example showing how a TCP server is established when ESP32-C2 works in the softAP mode. If ESP32-C2 works as a station, you can set up a server in the same way mentioned above after connecting ESP32-C2 to the router.

1. Set the Wi-Fi mode to softAP.

Command:

```
AT+CWMODE=2
```

Response:

```
OK
```

2. Enable multiple connections.

Command:

```
AT+CIPMUX=1
```

Response:

```
OK
```

3. Set softAP.

Command:

```
AT+CWSAP="ESP32_softAP","1234567890",5,3
```

Response:

```
OK
```

4. Query softAP information.

Command:

```
AT+CIPAP?
```

Response:

```
AT+CIPAP?  
+CIPAP:ip:"192.168.4.1"  
+CIPAP:gateway:"192.168.4.1"  
+CIPAP:netmask:"255.255.255.0"
```

```
OK
```

Note:

- The address you obtained may be different from that in the above response.

5. Set up a TCP server, the default port is 333.

Command:

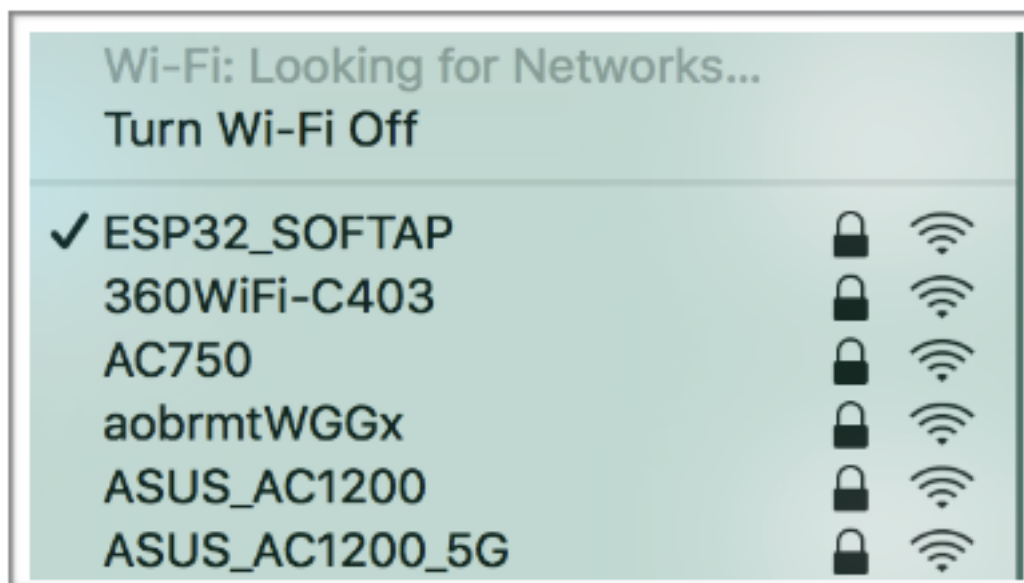

```
AT+CIPSERVER=1
```

Response:

```
OK
```

6. Connect the PC to the ESP32-C2 softAP.
7. Use a network tool on PC to create a TCP client and connect it to the TCP server that ESP32-C2 has created.
8. Send 4 bytes of data to connection link 0.

Command:

```
AT+CIPSEND=0,4
```

Response:

```
OK
```

```
>
```

Input 4 bytes, for example, `test`, then AT will respond the following messages.

```
Recv 4 bytes
```

```
SEND OK
```

Note:

- If the number of bytes inputted are more than the length (n) set by `AT+CIPSEND`, the system will reply `busy p...`, and send the first n bytes. And after sending the first n bytes, the system will reply `SEND OK`.
9. Receive 4 bytes of data from connection link 0.
Assume that the TCP server sends 4 bytes of data (data is `test`), the system will prompt:

```
+IPD,0,4:test
```

10. Close TCP connection.

Command:

```
AT+CIPCLOSE=0
```

Response:

```
0,CLOSED
```

```
OK
```

4.1.3 UDP transmission with fixed remote IP address and port

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP
OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Query the device's IP address.

Command:

```
AT+CIPSTA?
```

Response:

```
+CIPSTA:ip:"192.168.3.112"
+CIPSTA:gateway:"192.168.3.1"
+CIPSTA:netmask:"255.255.255.0"
OK
```

Note:

- The query results you obtained may be different from those in the above response.

4. Connect the PC to the same router which ESP32-C2 is connected to.

Use a network tool on the PC to create UDP transmission. For example, the PC's IP address is 192.168.3.102, and the port is 8080.

5. Enable multiple connections.

Command:

```
AT+CIPMUX=1
```

Response:

```
OK
```

6. Create a UDP transmission. The connection link is 4, the remote host's IP address is 192.168.3.102, the remote port is 8080, the local port is 1112, and the mode is 0.

Important: In UDP transmission, whether the remote IP address and port are fixed or not is determined by the *mode* parameter of *AT+CIPSTART*. If the parameter is 0, a specific connection link ID will be given to ensure that the remote IP address and port are fixed and the data sender and receiver will not be replaced by other devices.

Command:

```
AT+CIPSTART=4,"UDP","192.168.3.102",8080,1112,0
```

Response:

```
4,CONNECT
OK
```

Note:

- "192.168.3.102" and 8080 are the remote IP address and port of UDP transmission on the remote side, i.e., the UDP configuration set by PC.
- 1112 is the local port number of ESP32-C2. You can define this port number, or else, a random port will be used.
- 0 means that the remote IP address and port are fixed and cannot be changed. For example, when there is another PC creating a UDP entity and sending data to ESP32-C2 port 1112, ESP32-C2 will still receive the data from UDP port 1112, and if the AT command `AT+CIPSEND=4,X` is used, the data will still be sent to the first PC end. However, if the parameter is not set as 0, the data will be sent to the new PC.

7. Send 7 bytes of data to connection link 4.

Command:

```
AT+CIPSEND=4,7
```

Response:

```
OK
```

```
>
```

Input 7 bytes, for example, `abcdefg`, then AT will respond the following messages.

```
Recv 7 bytes
```

```
SEND OK
```

Note:

- If the number of bytes inputted are more than the length (n) set by `AT+CIPSEND`, the system will reply `busy p...`, and send the first n bytes. And after sending the first n bytes, the system will reply `SEND OK`.

8. Receive 4 bytes of data from connection link 4.

Assume that the PC sends 4 bytes of data (data is `test`), the system will prompt:

```
+IPD,4,4:test
```

9. Close UDP connection link 4.

Command:

```
AT+CIPCLOSE=4
```

Response:

```
4,CLOSED
```

```
OK
```

4.1.4 UDP transmission with changeable remote IP address and port

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Query the device's IP address.

Command:

```
AT+CIPSTA?
```

Response:

```
+CIPSTA:ip:"192.168.3.112"
+CIPSTA:gateway:"192.168.3.1"
+CIPSTA:netmask:"255.255.255.0"

OK
```

Note:

- The query results you obtained may be different from those in the above response.

4. Connect the PC to the same router which ESP32-C2 is connected to.

Use a network tool on the PC to create UDP transmission. For example, the PC's IP address is 192.168.3.102, and the port is 8080.

5. Enable single connections.

Command:

```
AT+CIPMUX=0
```

Response:

```
OK
```

6. Create a UDP transmission. The remote host's IP address is 192.168.3.102, the remote port is 8080, the local port is 1112, and the mode is 2.

Command:

```
AT+CIPSTART="UDP", "192.168.3.102", 8080, 1112, 2
```

Response:

```
CONNECT

OK
```

Note:

- "192.168.3.102" and 8080 are the remote IP address and port of UDP transmission on the remote side, i.e., the UDP configuration set by PC.
- 1112 is the local port number of ESP32-C2. You can define this port number, or else, a random port will be used.
- 2 means the opposite terminal of UDP transmission can be changed. The remote IP address and port will be automatically changed to those of the last UDP connection to ESP32-C2.

7. Send 4 bytes of data.

Command:

```
AT+CIPSEND=4
```

Response:

```
OK

>
```

Input 4 bytes, for example, test, then AT will respond the following messages.

```
Recv 4 bytes
```

```
SEND OK
```

Note:

- If the number of bytes inputted are more than the length (n) set by AT+CIPSEND, the system will reply busy p . . . , and send the first n bytes. And after sending the first n bytes, the system will reply SEND OK.

8. Send data to any other UDP terminal. For example, you can send 4 bytes of data with the remote host's IP address as 192.168.3.103 and the remote port as 1000.

If you want to send data to any other UDP terminal, please designate the IP address and port of the target terminal in the command.

Command:

```
AT+CIPSEND=4,"192.168.3.103",1000
```

Response:

```
OK
```

```
>
```

Input 4 bytes, for example, test, then AT will respond the following messages.

```
Recv 4 bytes
```

```
SEND OK
```

9. Receive 4 bytes of data.

Assume that the PC sends 4 bytes of data (data is test), the system will prompt:

```
+IPD,4:test
```

10. Close UDP connection.

Command:

```
AT+CIPCLOSE
```

Response:

```
CLOSED
```

```
OK
```

4.1.5 ESP32-C2 as an SSL client in single connection

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
```

```
WIFI GOT IP
```

(continues on next page)

(continued from previous page)

OK

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Query the device's IP address.

Command:

AT+CIPSTA?

Response:

```
+CIPSTA:ip:"192.168.3.112"
+CIPSTA:gateway:"192.168.3.1"
+CIPSTA:netmask:"255.255.255.0"
```

OK

Note:

- The query results you obtained may be different from those in the above response.

4. Connect the PC to the same router which ESP32-C2 is connected to.

5. Use the OpenSSL command on the PC to create an SSL server. For example, the SSL server on PC is 192.168.3.102, and the port is 8070.

Command:

```
openssl s_server -cert /home/esp-at/components/customized_partitions/raw_data/
→server_cert/server_cert.crt -key /home/esp-at/components/customized_
→partitions/raw_data/server_key/server.key -port 8070
```

Response:

ACCEPT

6. Connect the ESP32-C2 to the SSL server as a client over SSL. The server's IP address is 192.168.3.102, and the port is 8070.

Command:

AT+CIPSTART="SSL", "192.168.3.102", 8070

Response:

CONNECT

OK

7. Send 4 bytes of data.

Command:

AT+CIPSEND=4

Response:

OK

>

Input 4 bytes, for example, test, then AT will respond the following message.

Recv 4 bytes

SEND OK

Note:

- If the number of bytes inputted are more than the length (n) set by AT+CIPSEND, the system will reply busy p . . . , and send the first n bytes. And after sending the first n bytes, the system will reply SEND

OK.

8. Receive 4 bytes of data.

Assume that the SSL server sends 4 bytes of data (data is `test`), the system will prompt:

```
+IPD,4:test
```

4.1.6 ESP32-C2 as an SSL server in multiple connections

When ESP32-C2 works as an SSL server, multiple connections should be enabled by `AT+CIPMUX=1` command, because in most cases more than one client needs to be connected to the ESP32-C2 server.

Below is an example showing how an SSL server is established when ESP32-C2 works in the softAP mode. If ESP32-C2 works as a station, after connecting to the router, follow the steps for establishing a connection to an SSL server in this example.

1. Set the Wi-Fi mode to softAP.

Command:

```
AT+CWMODE=2
```

Response:

```
OK
```

2. Enable multiple connections.

Command:

```
AT+CIPMUX=1
```

Response:

```
OK
```

3. Configure the ESP32-C2 softAP.

Command:

```
AT+CWSAP="ESP32_softAP","1234567890",5,3
```

Response:

```
OK
```

4. Query softAP information.

Command:

```
AT+CIPAP?
```

Response:

```
AT+CIPAP?  
+CIPAP:ip:"192.168.4.1"  
+CIPAP:gateway:"192.168.4.1"  
+CIPAP:netmask:"255.255.255.0"
```

```
OK
```

Note:

- The address you obtained may be different from that in the above response.

5. Set up an SSL server.

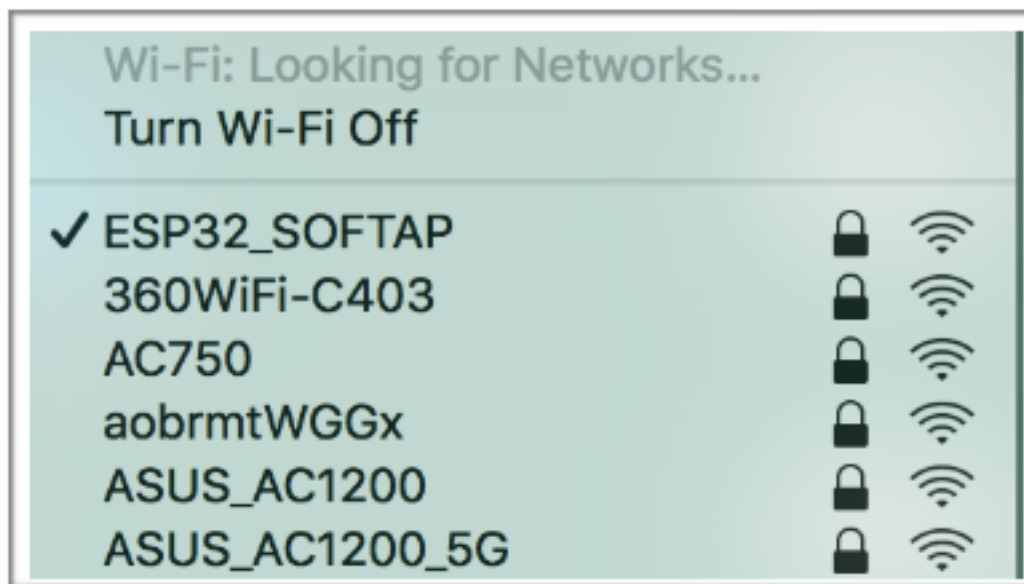

Command:

```
AT+CIPSERVER=1,8070,"SSL"
```

Response:

OK

6. Connect the PC to the ESP32-C2 softAP.

7. Use the OpenSSL command on PC to create an SSL client and connect it to the SSL server that ESP32-C2 has created.

Command:

openssl s_client -host 192.168.4.1 -port 8070

Response on the ESP32-C2:

CONNECT

8. Send 4 bytes of data to connection link 0.

Command:

AT+CIPSEND=0,4

Response:

OK

>

Input 4 bytes, for example, `test`, then AT will respond the following messages.

Recv 4 bytes

SEND OK

Note:

- If the number of bytes inputted are more than the length (n) set by `AT+CIPSEND`, the system will reply `busy p...`, and send the first n bytes. And after sending the first n bytes, the system will reply `SEND OK`.

9. Receive 4 bytes of data from connection link 0.

Assume that the SSL server sends 4 bytes of data (data is `test`), the system will prompt:

+IPD,0,4:test

10. Close SSL connection.

Command:

```
AT+CIPCLOSE=0
```

Response:

```
0,CLOSED  
OK
```

4.1.7 ESP32-C2 as an SSL client to create a single connection with mutual authentication

The certificate used in the example is the default certificate in esp-at. You can also generate and flash your own the certificate, then you need replace the SSL server certificate path below with your certificate path. To obtain the SSL certificate, please refer to [tools/README.md](#) for how to generate the certificate bin and esp-at/module_config/module_name/at_customize.csv for where to flash it.

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED  
WIFI GOT IP  
OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Set the SNTP server.

Command:

```
AT+CIPSNTPCFG=1,8,"cn.ntp.org.cn","ntp.sjtu.edu.cn"
```

Response:

```
OK
```

Note:

- You can set the SNTP server according to your country' s time zone.

4. Query the SNTP time.

Command:

```
AT+CIPSNTPTIME?
```

Response:

```
+CIPSNTPTIME:Mon Oct 18 20:12:27 2021  
OK
```

Note:

- You can check whether the SNTP time matches the real-time time to determine whether the SNTP server you set takes effect.

5. Query the device' s IP address.

Command:

```
AT+CIPSTA?
```

Response:

```
+CIPSTA:ip:"192.168.3.112"  
+CIPSTA:gateway:"192.168.3.1"  
+CIPSTA:netmask:"255.255.255.0"
```

```
OK
```

Note:

- The query results you obtained may be different from those in the above response.

6. Connect the PC to the same router which ESP32-C2 is connected to.
7. Use the OpenSSL command on the PC to create an SSL server. For example, the SSL server on PC is 192.168.3.102, and the port is 8070.

Command:

```
openssl s_server -CAfile /home/esp-at/components/customized_partitions/raw_  
→data/server_ca/server_ca.crt -cert /home/esp-at/components/customized_  
→partitions/raw_data/server_cert/server_cert.crt -key /home/esp-at/components/  
→customized_partitions/raw_data/server_key/server.key -port 8070 -verify_  
→return_error -verify_depth 1 -Verify 1
```

Response on the ESP32-C2:

```
CONNECT
```

Note:

- The certificate path in the command can be adjusted according to the location of your certificate.

8. The ESP32-C2 sets up the SSL client mutual authentication configuration.

Command:

```
AT+CIPSSLCONF=3,0,0
```

Response:

```
OK
```

9. Connect the ESP32-C2 to the SSL server as a client over SSL. The server's IP address is 192.168.3.102, and the port is 8070.

Command:

```
AT+CIPSTART="SSL", "192.168.3.102", 8070
```

Response:

```
CONNECT
```

```
OK
```

10. Send 4 bytes of data.

Command:

```
AT+CIPSEND=4
```

Response:

```
OK
```

```
>
```

Input 4 bytes, for example, test, then AT will respond the following message.

```
Recv 4 bytes
```

```
SEND OK
```

Note:

- If the number of bytes inputted are more than the length (n) set by `AT+CIPSEND`, the system will reply `busy p . . .`, and send the first n bytes. And after sending the first n bytes, the system will reply `SEND OK`.

11. Receive 4 bytes of data.

Assume that the SSL server sends 4 bytes of data (data is `test`), the system will prompt:

```
+IPD,4:test
```

4.1.8 ESP32-C2 as an SSL server to create multiple connections with mutual authentication

When ESP32-C2 works as an SSL server, multiple connections should be enabled by `AT+CIPMUX=1` command, because in most cases more than one client needs to be connected to the ESP32-C2 server.

Below is an example showing how an SSL server is established when ESP32-C2 works in the station mode. If ESP32-C2 works as a softAP, refer to the example of [ESP32-C2 as an SSL server in multiple connections](#).

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP
OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Query the device's IP address.

Command:

```
AT+CIPSTA?
```

Response:

```
+CIPSTA:ip:"192.168.3.112"
+CIPSTA:gateway:"192.168.3.1"
+CIPSTA:netmask:"255.255.255.0"
OK
```

Note:

- The query results you obtained may be different from those in the above response.

4. Enable multiple connections.

Command:

```
AT+CIPMUX=1
```

Response:

OK

- Set up an SSL server.

Command:

AT+CIPSERVER=1,8070,"SSL",1

Response:

OK

- Connect the PC to the ESP32-C2 softAP.

- Use the OpenSSL command on PC to create an SSL client and connect it to the SSL server that ESP32-C2 has created.

Command:

```
openssl s_client -CAfile /home/esp-at/components/customized_partitions/raw_
data/client_ca/client_ca_00.crt -cert /home/esp-at/components/customized_
partitions/raw_data/client_cert/client_cert_00.crt -key /home/esp-at/
components/customized_partitions/raw_data/client_key/client_key_00.key -host_
192.168.3.112 -port 8070
```

Response on the ESP32-C2:

0,CONNECT

- Send 4 bytes of data to connection link 0.

Command:

AT+CIPSEND=0,4

Response:

OK

>

Input 4 bytes, for example, test, then AT will respond the following messages.

Recv 4 bytes

SEND OK

Note:

- If the number of bytes inputted are more than the length (n) set by AT+CIPSEND, the system will reply busy p . . . , and send the first n bytes. And after sending the first n bytes, the system will reply SEND OK.
9. Receive 4 bytes of data from connection link 0.
Assume that the SSL server sends 4 bytes of data (data is test), the system will prompt:

```
+IPD,0,4:test
```

10. Close SSL connection.
Command:

```
AT+CIPCLOSE=0
```

Response:

```
0,CLOSED
```

```
OK
```

11. Close SSL server.
Command:

```
AT+CIPSERVER=0
```

Response:

```
OK
```

4.1.9 UART Wi-Fi passthrough transmission when the ESP32-C2 works as a TCP client in single connection

1. Set the Wi-Fi mode to station.
Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.
Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
```

```
WIFI GOT IP
```

```
OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Query the device's IP address.
Command:

```
AT+CIPSTA?
```

Response:

```
+CIPSTA:ip:"192.168.3.112"
```

```
+CIPSTA:gateway:"192.168.3.1"
```

(continues on next page)

(continued from previous page)

```
+CIPSTA:netmask:"255.255.255.0"
```

```
OK
```

Note:

- The query results you obtained may be different from those in the above response.
4. Connect the PC to the same router which ESP32-C2 is connected to.
Use a network tool on the PC to create a TCP server. For example, the TCP server on PC is 192.168.3.102, and the port is 8080.
 5. Connect the ESP32-C2 to the TCP server as a TCP client over TCP. The server's IP address is 192.168.3.102, and the port is 8080.
Command:

```
AT+CIPSTART="TCP", "192.168.3.102", 8080
```

Response:

```
CONNECT
```

```
OK
```

6. Enable the UART Wi-Fi *Passthrough Receiving Mode*.
Command:

```
AT+CIPMODE=1
```

Response:

```
OK
```

7. Enter the UART Wi-Fi *Passthrough Mode* and send data.
Command:

```
AT+CIPSEND
```

Response:

```
OK
```

```
>
```

8. Stop sending data.
When receiving a packet that contains only +++, the UART Wi-Fi passthrough transmission process will be stopped. Then please wait at least 1 second before sending the next AT command. Please note that if you input +++ directly by typing, the +++ may not be recognized as three consecutive + because of the prolonged typing duration. For more details, please refer to [\[Passthrough Mode Only\] +++](#).

Important: The aim of ending the packet with +++ is to exit *Passthrough Mode* and to accept normal AT commands, while TCP still remains connected. However, you can also use command AT+CIPSEND to go back into *Passthrough Mode*.

9. Exit the UART Wi-Fi *Passthrough Receiving Mode*.
Command:

```
AT+CIPMODE=0
```

Response:

```
OK
```

10. Close TCP connection.
Command:

```
AT+CIPCLOSE
```

Response:

```
CLOSED
```

```
OK
```

4.1.10 UART Wi-Fi passthrough transmission when the ESP32-C2 works as a TCP server

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED  
WIFI GOT IP
```

```
OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Enable multiple connections.

Command:

```
AT+CIPMUX=1
```

Response:

```
OK
```

Note:

- TCP server can be created only in multiple connections.

4. Set the maximum number of TCP server connections to 1.

Command:

```
AT+CIPSERVERMAXCONN=1
```

Response:

```
OK
```

Note:

- The passthrough mode is point-to-point, so the maximum number of connections to the TCP server can only be 1.

5. Create TCP server.

Command:

```
AT+CIPSERVER=1,8080
```

Response:

OK

Note:

- Set the TCP server port to 8080. You can also set it to other port.

6. Query the device's IP address.

Command:

AT+CIPSTA?

Response:

+CIPSTA:ip:"192.168.3.112"
+CIPSTA:gateway:"192.168.3.1"
+CIPSTA:netmask:"255.255.255.0"

OK

Note:

- The query results you obtained may be different from those in the above response.

7. Connect the PC to the ESP32-C2 TCP server

Connect the PC to the same router which ESP32-C2 is connected to.

Use a network tool on the PC to create a TCP client and connect to the ESP32-C2 TCP server. The remote address is 192.168.3.112, and the port is 8080.

AT Response:

0,CONNECT

8. Enable the UART Wi-Fi *Passthrough Receiving Mode*.

Command:

AT+CIPMODE=1

Response:

OK

9. Enter the UART Wi-Fi *Passthrough Mode* and send data.

Command:

AT+CIPSEND

Response:

OK

>

10. Stop sending data.

When receiving a packet that contains only +++, the UART Wi-Fi passthrough transmission process will be stopped. Then please wait at least 1 second before sending the next AT command. Please note that if you input +++ directly by typing, the +++ may not be recognized as three consecutive + because of the prolonged typing duration. For more details, please refer to [\[Passthrough Mode Only\] +++](#).

Important: The aim of ending the packet with +++ is to exit *Passthrough Mode* and to accept normal AT commands, while TCP still remains connected. However, you can also use command AT+CIPSEND to go back into *Passthrough Mode*.

11. Exit the UART Wi-Fi *Passthrough Receiving Mode*.

Command:

AT+CIPMODE=0

Response:

OK

12. Close TCP connection.

Command:

AT+CIPCLOSE

Response:

CLOSED

OK

4.1.11 UART Wi-Fi passthrough transmission when the ESP32-C2 works as a softAP in UDP transparent transmission

1. Set the Wi-Fi mode to softAP.

Command:

AT+CWMODE=2

Response:

OK

2. Set softAP.

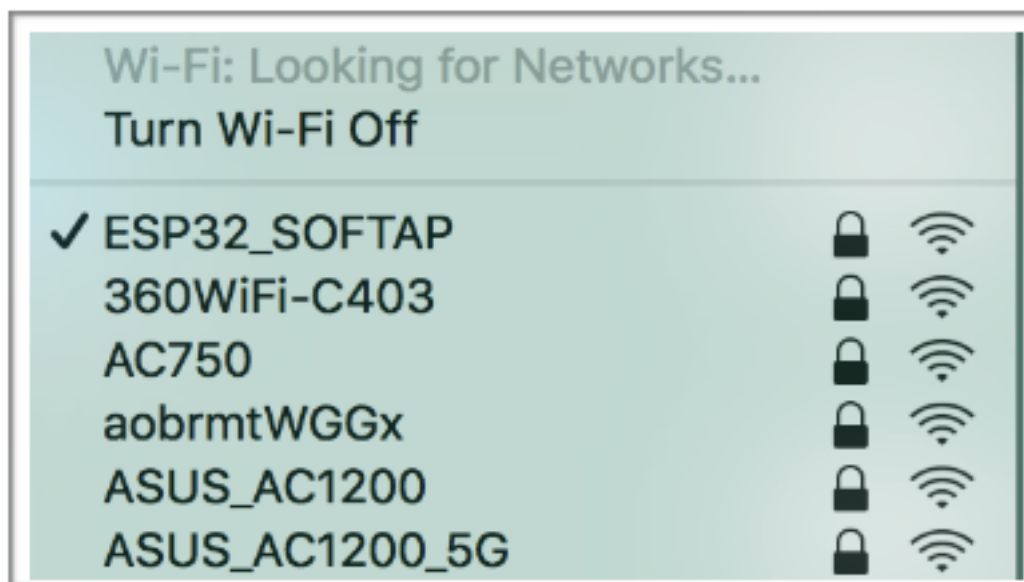

Command:

AT+CWSAP="ESP32_softAP", "1234567890", 5, 3

Response:

OK

3. Connect the PC to the ESP32-C2 softAP.

4. Create a UDP endpoint.

Use a network tool on PC to create a UDP endpoint. For example, the PC's IP address is 192.168.4.2 and the port is 8080.

5. Create a UDP transmission between ESP32-C2 and the PC with a fixed remote IP address and port. The remote host's IP address is 192.168.4.2, the remote port is 8080, the local port is 2233, and the mode is 0.

Command:

```
AT+CIPSTART="UDP","192.168.4.2",8080,2233,0
```

Response:

```
CONNECT
```

```
OK
```

6. Enter the UART Wi-Fi *Passthrough Receiving Mode*.

Command:

```
AT+CIPMODE=1
```

Response:

```
OK
```

7. Enter the UART Wi-Fi *Passthrough Mode* and send data.

Command:

```
AT+CIPSEND
```

Response:

```
OK
```

```
>
```

8. Stop sending data.

When receiving a packet that contains only +++, the UART Wi-Fi passthrough transmission process will be stopped. Then please wait at least 1 second before sending the next AT command. Please note that if you input +++ directly by typing, the +++ may not be recognized as three consecutive + because of the prolonged typing duration. For more details, please refer to [\[Passthrough Mode Only\] +++](#).

Important: The aim of ending the packet with +++ is to exit *Passthrough Mode* and to accept normal AT commands, while TCP still remains connected. However, you can also use command AT+CIPSEND to go back into *Passthrough Mode*.

9. Exit the UART Wi-Fi *Passthrough Receiving Mode*.

Command:

```
AT+CIPMODE=0
```

Response:

```
OK
```

10. Close TCP connection.

Command:

```
AT+CIPCLOSE
```

Response:

```
CLOSED
```

```
OK
```

4.2 MQTT AT Examples

This document provides detailed command examples to illustrate how to utilize *MQTT AT Commands* on ESP32-C2.

- *MQTT over TCP (with a local MQTT broker)(suitable for a small amount of data)*
- *MQTT over TCP (with a local MQTT broker)(suitable for large amounts of data)*
- *MQTT over TLS (with a local MQTT broker)*
- *MQTT over WSS*

Important:

- The examples described in this document are based on the situation that Wi-Fi has been connected.
-

4.2.1 MQTT over TCP (with a local MQTT broker)(suitable for a small amount of data)

Below is an example of using two ESP32-C2 development boards, one as a MQTT publisher (only as MQTT publisher role), the other one as a MQTT subscriber (only as MQTT subscriber role).

The example shows how to establish MQTT connections over TCP. You need to first create a local MQTT broker. For example, the MQTT broker's IP address is 192.168.3.102, and the port is 8883.

Important: In the step, the operations starting with ESP32-C2 MQTT publisher only need to be executed at ESP32-C2 MQTT publisher, and the operations starting with ESP32-C2 MQTT subscriber only need to be executed at ESP32-C2 MQTT subscriber. If the operation is not specified on which side it is executed, it needs to be executed on both the publisher side and the subscriber side.

1. Set MQTT user configuration.

ESP32-C2 MQTT publisher:

Command:

```
AT+MQTTUSERCFG=0,1,"publisher","espressif","123456789",0,0,""
```

Response:

```
OK
```

ESP32-C2 MQTT subscriber:

Command:

```
AT+MQTTUSERCFG=0,1,"subscriber","espressif","123456789",0,0,""
```

Response:

```
OK
```

2. Connect to MQTT brokers.

Command:

```
AT+MQTTCONN=0,"192.168.3.102",8883,1
```

Response:

```
+MQTTCONNECTED:0,1,"192.168.3.102","8883","",1
```

```
OK
```

Note:

- The MQTT broker domain or MQTT broker IP address you enter may be different from those in the above command.

3. Subscribe to MQTT topics.

ESP32-C2 MQTT subscriber:

Command:

```
AT+MQTTSUB=0,"topic",1
```

Response:

```
OK
```

4. Publish MQTT messages in string.

ESP32-C2 MQTT publisher:

Command:

```
AT+MQTTPUB=0,"topic","test",1,0
```

Response:

```
OK
```

Note:

- If the ESP32-C2 MQTT publisher successfully publishes the message, following message will be prompted on the ESP32-C2 MQTT subscriber.

```
+MQTTSUBRECV:0,"topic",4,test
```

5. Close MQTT connections.

Command:

```
AT+MQTTCLEAN=0
```

Response:

```
OK
```

4.2.2 MQTT over TCP (with a local MQTT broker)(suitable for large amounts of data)

Below is an example of using two ESP32-C2 development boards, one as a MQTT publisher (only as MQTT publisher role), the other one as a MQTT subscriber (only as MQTT subscriber role).

The example shows how to establish MQTT connections over TCP. You need to first create a local MQTT broker. For example, the MQTT broker's IP address is 192.168.3.102, and the port is 8883.

If the amount of data you publish is relatively large, and the length of a single AT command has exceeded the threshold of 256, it is recommended that you use the [AT+MQTTPUBRAW](#) command.

Important: In the step, the operations starting with ESP32-C2 MQTT publisher only need to be executed at ESP32-C2 MQTT publisher, and the operations starting with ESP32-C2 MQTT subscriber only need to be executed at ESP32-C2 MQTT subscriber. If the operation is not specified on which side it is executed, it needs to be executed on both the publisher side and the subscriber side.

1. Set MQTT user configuration.

ESP32-C2 MQTT publisher:

Command:

```
AT+MQTTUSERCFG=0,1,"publisher","espressif","123456789",0,0,""
```

Response:

```
OK
```

ESP32-C2 MQTT subscriber:

Command:

```
AT+MQTTUSERCFG=0,1,"subscriber","espressif","123456789",0,0,""
```

Response:

```
OK
```

2. Connect to MQTT brokers.

Command:

```
AT+MQTTCONN=0,"192.168.3.102",8883,1
```

Response:

```
+MQTTCONNECTED:0,1,"192.168.3.102","8883","",1
```

```
OK
```

Note:

- The MQTT broker domain or MQTT broker IP address you enter may be different from those in the above command.

3. Subscribe to MQTT topics.

ESP32-C2 MQTT subscriber:

Command:

```
AT+MQTTSUB=0,"topic",1
```

Response:

```
OK
```

4. Publish MQTT messages in string.

Assume the data you want to publish is as follows, length is 427 bytes.

```
{ "headers": { "Accept": "application/json", "Accept-Encoding": "gzip, deflate",
  ↳ "Accept-Language": "en-US,en;q=0.9,zh-CN;q=0.8,zh;q=0.7", "Content-Length": "0
  ↳ ", "Host": "httpbin.org", "Origin": "http://httpbin.org", "Referer": "http://
  ↳ httpbin.org/", "User-Agent": "Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.
  ↳ 36 (KHTML, like Gecko) Chrome/91.0.4472.114 Safari/537.36", "X-Amzn-Trace-Id
  ↳ ": "Root=1-6150581e-1ad4bd5254b4bf5218070413" } }
```

ESP32-C2 MQTT publisher:

Command:

```
AT+MQTTPUBRAW=0,"topic",427,0,0
```

Response:

```
OK
```

```
>
```

This response indicates that AT is ready for receiving serial data. You should enter the data, and when the data length reaches the <length> value, the transmission of data starts.

```
+MQTTPUB:OK
```

Note:

- After AT outputs the > character, the special characters in the data does not need to be escaped through the escape character, and it does not need to end with a new line(CR-LF).
- If the ESP32-C2 MQTT publisher successfully publishes the message, following message will be prompted on the ESP32-C2 MQTT subscriber.

```
+MQTTSUBRECV:0,"topic",427,{ "headers": { "Accept": "application/json",
  ↳ "Accept-Encoding": "gzip, deflate", "Accept-Language": "en-US,en;q=0.9,zh-
  ↳ CN;q=0.8,zh;q=0.7", "Content-Length": "0", "Host": "httpbin.org", "Origin":
  ↳ "http://httpbin.org", "Referer": "http://httpbin.org/", "User-Agent":
  ↳ "Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.36 (KHTML, like Gecko)
  ↳ Chrome/91.0.4472.114 Safari/537.36", "X-Amzn-Trace-Id": "Root=1-6150581e-
  ↳ 1ad4bd5254b4bf5218070413" } }
```

5. Close MQTT connections.

Command:

```
AT+MQTTCLEAN=0
```

Response:

```
OK
```

4.2.3 MQTT over TLS (with a local MQTT broker)

Below is an example of using two ESP32-C2 development boards, one as a MQTT publisher (only as MQTT publisher role), the other one as a MQTT subscriber (only as MQTT subscriber role).

The example shows how to establish MQTT connections over TLS. You need to first create a local MQTT broker. For example, the MQTT broker's IP address is 192.168.3.102, and port is 8883.

Important: In the step, the operations starting with ESP32-C2 MQTT publisher only need to be executed at ESP32-C2 MQTT publisher, and the operations starting with ESP32-C2 MQTT subscriber only need to be executed at ESP32-C2 MQTT subscriber. If the operation is not specified on which side it is executed, it needs to be executed on both the publisher side and the subscriber side.

1. Set the time zone and the SNTP server.

Command:

```
AT+CIPSNTPCFG=1,8,"ntp1.aliyun.com"
```

Response:

```
OK
```

2. Query the SNTP time.

Command:

```
AT+CIPSNTPTIME?
```

Response:

```
+CIPSNTPTIME:Thu Sep  2 18:57:03 2021
OK
```

Note:

- The time you obtained may be different from that in the above response.
- Please make sure that the SNTP time must be a real and valid time and cannot be the time in 1970 or before.
- The purpose of setting the time is to verify the validity period of the certificates during TLS authentication.

3. Set MQTT user configuration.

ESP32-C2 MQTT publisher:

Command:

```
AT+MQTTUSERCFG=0,4,"publisher","espressif","123456789",0,0,""
```

Response:

```
OK
```

ESP32-C2 MQTT subscriber:

Command:

```
AT+MQTTUSERCFG=0,4,"subscriber","espressif","123456789",0,0,""
```

Response:

OK

4. Set configuration of MQTT connection.

Command:

AT+MQTTCONNCFG=0,0,0,"lwtt","lwtm",0,0

Response:

OK

5. Connect to MQTT brokers.

Command:

AT+MQTTCONN=0,"192.168.3.102",8883,1

Response:

+MQTTCONNECTED:0,4,"192.168.3.102","8883","",1

OK

Note:

- The MQTT broker domain or MQTT broker IP address you enter may be different from those in the above command.

6. Subscribe to MQTT topics.

ESP32-C2 MQTT subscriber:

Command:

AT+MQTTSUB=0,"topic",1

Response:

OK

7. Publish MQTT messages in string.

ESP32-C2 MQTT publisher:

Command:

AT+MQTTPUB=0,"topic","test",1,0

Response:

OK

Note:

- If the ESP32-C2 MQTT publisher successfully publishes the message, following message will be prompted on the ESP32-C2 MQTT subscriber.

+MQTTSUBRECV:0,"topic",4,test

8. Close MQTT connections.

Command:

AT+MQITCLEAN=0

Response:

OK

4.2.4 MQTT over WSS

Below is an example of using two ESP32-C2 development boards, one as a MQTT publisher (only as MQTT publisher role), the other one as a MQTT subscriber (only as MQTT subscriber role).

The example shows how to establish MQTT connections over WSS and how to communicate with a MQTT broker. For example, the MQTT broker's domain name is `test.mosquitto.org`, and the port is 8081.

Important: In the step, the operations starting with ESP32-C2 MQTT publisher only need to be executed at ESP32-C2 MQTT publisher, and the operations starting with ESP32-C2 MQTT subscriber only need to be executed at ESP32-C2 MQTT subscriber. If the operation is not specified on which side it is executed, it needs to be executed on both the publisher side and the subscriber side.

1. Set the time zone and the SNTP server.

Command:

```
AT+CIPSNTPCFG=1,8,"ntp1.aliyun.com"
```

Response:

```
OK
```

2. Query the SNTP time.

Command:

```
AT+CIPSNTPTIME?
```

Response:

```
+CIPSNTPTIME:Thu Sep  2 18:57:03 2021
OK
```

Note:

- The time you obtained may be different from that in the above response.
- Please make sure that the SNTP time must be a real and valid time and cannot be the time in 1970 or before.
- The purpose of setting the time is to verify the validity period of the certificates during TLS authentication.

3. Set MQTT user configuration.

ESP32-C2 MQTT publisher:

Command:

```
AT+MQTTUSERCFG=0,7,"publisher","espressif","1234567890",0,0,""
```

Response:

```
OK
```

ESP32-C2 MQTT subscriber:

Command:

```
AT+MQTTUSERCFG=0,7,"subscriber","espressif","1234567890",0,0,""
```

Response:

```
OK
```

4. Connect to MQTT brokers.

Command:

```
AT+MQTTCONN=0,"test.mosquitto.org",8081,1
```

Response:

```
+MQTTCONNECTED:0,7,"test.mosquitto.org","8081","/",1
OK
```

Note:

- The MQTT broker domain or MQTT broker IP address you enter may be different from those in the above command.

5. Subscribe to MQTT topics.

ESP32-C2 MQTT subscriber:

Command:

```
AT+MQTTSUB=0,"topic",1
```

Response:

```
OK
```

6. Publish MQTT messages in string.

ESP32-C2 MQTT publisher:

Command:

```
AT+MQTTPUB=0,"topic","test",1,0
```

Response:

```
OK
```

Note:

- If the ESP32-C2 MQTT publisher successfully publishes the message, following message will be prompted on the ESP32-C2 MQTT subscriber.

```
+MQTTSUBRECV:0,"topic",4,test
```

7. Close MQTT connections.

Command:

```
AT+MQTTCLEAN=0
```

Response:

```
OK
```

4.3 MQTT AT Examples for Cloud

This document mainly describes how to connect your ESP32-C2 to AWS IoT with MQTT AT commands.

Important: For details on how to use MQTT AT commands, please refer to [MQTT AT Commands](#). You need to become familiar with the AWS IoT by reading the [AWS IoT Development Guide](#).

Please follow the steps below to connect your ESP32-C2 to AWS IoT with ESP-AT.

- [Obtain certificates and endpoints from AWS IoT](#)
 - [Connect to AWS IoT based on mutual authentication with MQTT AT commands](#)

4.3.1 Obtain certificates and endpoints from AWS IoT

1. Sign in to your AWS IoT Console account and switch to the IoT Core services.
2. Create an AWS IoT policy, thing, and certificates following the instructions in [Create AWS IoT Resources](#).

Make sure you have got the following certificate and key files:

- device.pem.crt (Device certificate)
- private.pem.key (Private key)
- Amazon-root-CA-1.pem (Root CA certificate)

3. Get the endpoint and bind the thing to the policy through the certificate according to the documentation [Set up the policy](#).

The endpoint value has the format of `xxx-ats.iot.us-east-2.amazonaws.com`.

Note: It is strongly recommended to familiarize yourself with the [AWS IoT Developer Guide](#). Below are some key points from this Guide that are worth noting.

- All devices must have a device certificate, private key, and root CA certificate installed in order to communicate with AWS IoT.
 - Information on how to activate certificates.
 - Select Ohio as your region.
-

4.3.2 Connect to AWS IoT based on mutual authentication with MQTT AT commands

Replace certificates

Open your local ESP-AT project and do the following:

- Replace `customized_partitions/raw_data/mqtt_ca/mqtt_ca.crt` with `Amazon-root-CA-1.pem`.
- Replace `customized_partitions/raw_data/mqtt_cert/mqtt_client.crt` with `device.pem.crt`.
- Replace `customized_partitions/raw_data/mqtt_key/mqtt_client.key` with `private.pem.key`.

Compile and flash the AT firmware

Compile the ESP-AT project to build the AT firmware, and flash the firmware to your ESP32-C2. For more information, please refer to [Compile ESP-AT Project](#).

Note: If you don't want to compile the ESP-AT project to replace certificates, you can directly use the AT command to replace certificates in the firmware. For more information, please refer to [How to Generate PKI Files](#).

Use AT commands to connect to AWS IoT

1. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to the AP.

Command:

```
AT+CWJAP=<ssid>,<password>
```

Response:

```
OK
```

3. Set the SNTP server.

Command:

```
AT+CIPSNTPCFG=1,8,"pool.ntp.org"
```

Response:

```
OK
```

4. Query the SNTP time.

Command:

```
AT+CIPSNTPTIME?
```

Response:

```
+CIPSNTPTIME:<asctime style time>
OK
```

Note:

- The `<asctime style time>` obtained at this time must be the real-time time of the set time zone, otherwise the connection will fail due to the validity period of the certificate.

5. Set MQTT user properties.

Command:

```
AT+MQTTUSERCFG=0,5,"esp32","espressif","1234567890",0,0,""
```

Response:

```
OK
```

Note:

- If the second parameter of `AT+MQTTUSERCFG` is 5, it is authenticated by both sides and cannot be changed.

6. Connect to AWS IoT.

Command:

```
AT+MQTTCONN=0,"<endpoint>",8883,1
```

Response:

```
+MQTTCONNECTED:0,5,<endpoint>,"8883","",1
OK
```

Note:

- Please fill in your endpoint value in the `<endpoint>` parameter.
- The port 8883 cannot be changed.

7. Subscribe to messages.

Command:

```
AT+MQTTSUB=0,"topic/esp32at",1
```

Response:

```
OK
```

8. Publish a message.

Command:

```
AT+MQTTPUB=0,"topic/esp32at","hello aws!",1,0
```

Response:

```
+MQTTSUBRECV:0,"topic/esp32at",10,hello aws!
OK
```

Example log

Log for normal interaction is as follows:

1. Log on the ESP32 side
2. Log on the AWS side

```

Release v2.3.0.0-esp32c3-361-gb5430077

4.4 Web Server AT Example

This document mainly introduces the use of AT web server, mainly involving the following applications:

- *Wi-Fi Provisioning Using a Browser*
- *OTA Firmware Upgrade Using a Browser*
- *Wi-Fi Provisioning Using a WeChat Applet*
- *OTA Firmware Upgrade Using a WeChat Applet*
- *ESP32-C2 Using Captive Portal*

Note: The default firmware does not support web server AT commands, please refer to [Web Server AT Commands](#) to enable the web server.

4.4.1 Wi-Fi Provisioning Using a Browser

Introduction

With the web server, mobile phone or PC is able to control ESP32-C2's Wi-Fi provisioning service. You can use a mobile phone or computer to connect to the SoftAP of the ESP32-C2, open the web pages via browser, start provisioning service, and then the ESP32-C2 can connect to the target router as you set.

Introduction to Operation Steps

The whole process can be divided into the following three steps:

- *Use STA Device to Connect to ESP32-C2 Device*
- *Use the Browser to Send Wi-Fi Connection Information*
- *Get the Result of Wi-Fi Connection*

Use STA Device to Connect to ESP32-C2 Device Firstly, ESP32-C2 needs to be configured to softAP + STA mode, and creates a web server to wait for Wi-Fi provisioning messages. In this case, a mobile phone or a PC can connect to the ESP32-C2 softAP as a station. The corresponding AT commands are as follows:

1. Clear the previous Wi-Fi provisioning information.

- Command

```
AT+RESTORE
```

2. Set the Wi-Fi mode to Station+SoftAP.

- Command

```
AT+CWMODE=3
```

3. Set the configuration of an ESP32-C2 SoftAP. (For example, set the default connection ssid to "pos_softap", Wi-Fi without password.)

- Command

```
AT+CWSAP="pos_softap","",11,0,3
```

4. Enable multiple connections.

- Command

```
AT+CIPMUX=1
```

5. Create a web server, port: 80, connection timeout: 25 s (default maximum is 60 s).

- Command

```
AT+WEBSERVER=1,80,25
```

After starting the web sever according to the above commands, you can turn on the Wi-Fi connection function on your STA device, and connect it to the softAP of the ESP32-C2:

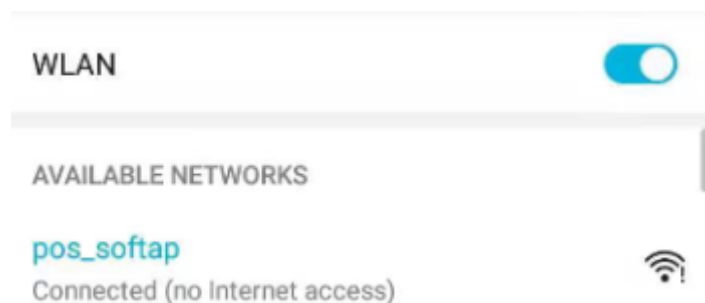

Fig. 1: Connection to the ESP32-C2 AP

Use the Browser to Send Wi-Fi Connection Information After your STA device connected to the ESP32-C2 softAP, it can send Wi-Fi connection information to ESP32-C2 in an HTTP request. Please note that if your target AP is the hotspot of the device which opens the web pages, you may not receive the Wi-Fi connection result. You can enter the default IP address of the web server in the browser (the default IP is 192.168.4.1, or you can query the current SoftAP IP address by command AT+CIPAP?), open the Wi-Fi provisioning interface, and enter the ssid and password of the router to be connected, click “Connect” to let ESP32-C2 start connecting to the router:

Or you can click the drop-down box of SSID to list all APs nearby, select the target AP and enter the password, and then click “Connect” to let the ESP32-C2 start connecting to the router:

Get the Result of Wi-Fi Connection After the Wi-Fi connection is established successfully, the web page will be displayed as follows:

Note 1: After the Wi-Fi connection is established successfully, the webpage will be closed automatically. If you want to continue to access the webpage, please re-enter the IP address of the ESP32-C2 and reopen the webpage.

At the same time, the following messages will be returned from the ESP-AT command port:

```
+WEBSERVERRSP:1      // meaning that ESP32-C2 has received Wi-Fi connection_
↪information
WIFI CONNECTED       // meaning that ESP32-C2 is connecting
WIFI GOT IP          // meaning that ESP32-C2 connect successfully to the_
↪destination router
+WEBSERVERRSP:2      // meaning that STA device has received Wi-Fi connection_
↪result, and web resources can be released
```

If the ESP32-C2 fails to connect to the router, the web page will display:

At the same time, the following messages will be returned from the ESP-AT command port:

```
+WEBSERVERRSP:1      // meaning that ESP32-C2 has received Wi-Fi connection_
↪information, but failed to connect to the router.
```

Troubleshooting

Note 1: The network configuration page received a prompt “Connection failed” . Please check whether the Wi-Fi AP of the ESP32-C2 module is correctly turned on, and the relevant configuration of the AP, and confirm that the

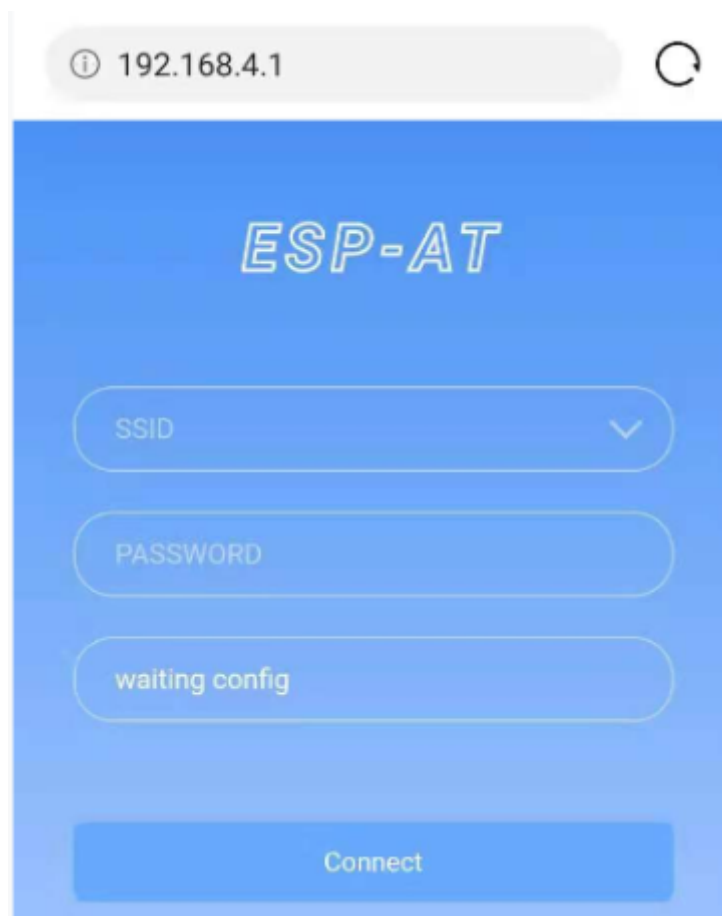

Fig. 2: Opening the Wi-Fi Provisioning Interface

Fig. 3: Schematic Diagram Of Browser Obtaining Wi-Fi AP List

Fig. 4: Wi-Fi Connection Established Successfully

Fig. 5: Failed Connection to the Router

correct AT command has been entered to successfully enable the web server.

4.4.2 OTA Firmware Upgrade Using a Browser

Introduction

After the browser opens the web page of the web server, you can choose to enter the OTA upgrade page to upgrade the firmware in the app partitions or the certificate binaries in other partitions (please refer to [How to Generate PKI Files](#) for more about certificate information).

Introduction to Operation Steps

- [Open the OTA Configuration Page](#)
- [Selecting the Partition to Upgrade](#)
- [Send the New Firmware](#)
- [Get the Result of OTA](#)

Open the OTA Configuration Page As shown in the figure, click on the “OTA” option in the lower right corner of the web page, and after opening the OTA configuration page, you can view the current firmware version and AT Core version:

Note 1: The configuration interface can only be opened when the STA device is connected to the AP of the ESP32-C2, or the STA device accessing the OTA configuration page is connected to the ESP32-C2 in the same subnet.

Note 2: The “current app version” displayed on the webpage is the version number of the application. You can change the version number through `./build.py menuconfig->Component config->AT->AT firmware version` (see [Compile ESP-AT Project](#)). In this case, you can manage your application firmware version.

Selecting the Partition to Upgrade As shown in the figure, click the drop-down box of “Partition” to obtain all partitions that can be upgraded:

Send the New Firmware As shown in the figure, click the “Browse” button on the page and select the new firmware to be sent:

Then you can click “OTA upgrade” button to send the firmware.

Note 1: For the ota partition, the web page will check the selected firmware. The suffix of the firmware name must be `.bin`. Please make sure that the firmware size does not exceed the size of the ota partition defined in the `partitions_at.csv` file. For more information on this file, please refer to [How to Add Support for a Module](#).

Note 2: For other partitions, the web page will check the selected firmware. The suffix of the firmware name must be `.bin`. Please make sure that the firmware size does not exceed the size defined in the `at_customize.csv` file. For more information on this file, please refer to [How to Customize Partitions](#).

Get the Result of OTA As shown in the figure, if the ESP32-C2 OTA successfully, it will prompt “OTA Succeeded” :

At the same time, the following messages will be returned from the ESP-AT command port:

```
+WEBSERVERRSP:3      // meaning that ESP32-C2 begin to receive OTA data
+WEBSERVERRSP:4      // meaning that ESP32-C2 has received all firmware data
```

If the ESP32-C2 OTA failed, it will prompt “OTA Failed” :

At the same time, the following message will be received on the serial port:

Fig. 6: OTA Configuration Page

Fig. 7: Obtaining All Partitions That Can Be Upgraded

Fig. 8: Selecting the New Firmware to Be Sent

Fig. 9: The New Firmware Sent Successfully

Fig. 10: Failed Sending of the New Firmware

```
+WEBSERVERRSP:3      // meaning that ESP32-C2 begin to receive OTA data
+WEBSERVERRSP:5      // meaning a failure of receiving OTA data failed. You can
↳ choose to reopen the OTA configuration interface and follow the above steps to
↳ restart the firmware upgrade
```

Note 1: For the ota partition, you need to execute *AT+RST* to restart the ESP32-C2 to apply the new firmware.

Note 2: ESP32-C2 will only verify the received ota firmware content. The firmware data received by other partitions will not be verified, so please make sure its content is correct.

4.4.3 Wi-Fi Provisioning Using a WeChat Applet

Introduction

The WeChat applet can automatically connect to the WiFi AP of the ESP32-C2, and then send the ssid and password required by the ESP32-C2 to connect to the network.

Introduction to Operation Steps

The whole process can be divided into the following four steps:

- *Configure ESP32-C2 Device Parameters*
- *Load WeChat Applet*
- *Target AP Selection*
- *Use the WeChat Applet to Send Wi-Fi Connection Information*

Configure ESP32-C2 Device Parameters Firstly, ESP32-C2 needs to be configured to softAP + STA mode, and creates a web server to wait for Wi-Fi provisioning messages. In this case, a mobile phone or a PC can connect to the ESP32-C2 softAP as a station. The corresponding AT commands are as follows:

1. Clear the previous Wi-Fi provisioning information.

- Command

```
AT+RESTORE
```

2. Set the Wi-Fi mode to Station+SoftAP.

- Command

```
AT+CWMODE=3
```

3. Set the configuration of an ESP32-C2 SoftAP. (For example, set the default connection ssid to “pos_softap”, and password to “espressif” .)

- Command

```
AT+CWSAP="pos_softap","espressif",11,3,3
```

Note: By default, the WeChat applet initiates a connection to the SoftAP whose ssid is *pos_softap* and password is *espressif*. Please make sure to set the parameters of the ESP32-C2 according to the above configuration.

1. Enable multiple connections.

- Command

```
AT+CIPMUX=1
```

2. Create a web server, port: 80, connection timeout: 40 s (default maximum is 60 s).

- Command

```
AT+WEBSERVER=1,80,40
```

Load WeChat Applet Open the mobile phone WeChat, scan the following QR code:

Fig. 11: Getting the QR Code of the Applet

Open the WeChat applet and enter the Wi-Fi provisioning interface:

Target AP Selection After loading the WeChat applet, there are two situations according to different target AP:

Situation 1. If your target AP is the hotspot of the mobile phone which running the WeChat applet, please select the “Local phone hotspot” option box on the WeChat applet page.

Situation 2. If your target AP is just another AP, not as the special situation one as above, then please do not select the “Local phone hotspot” option box.

Use the WeChat Applet to Send Wi-Fi Connection Information

The target AP to be accessed is not the hotspot provided by the mobile phone which loading the WeChat applet. Here, take connecting to a router as an example, the process of Wi-Fi Connection configuration is introduced:

1. Turn on the mobile Wi-Fi and connect to the router:
2. Open the WeChat applet, you can see that the applet page has automatically displayed the ssid of the current router as “FAST_FWR310_02” .

Note: If the ssid of the connected router is not displayed on the current page, please click “Re-enter applet” in the following figure to refresh the current page:

3. After entering the password of the router, click “Connect” .
4. After the Wi-Fi connection is established successfully, the web page will be displayed as follows:

At the same time, the following messages will be returned from the ESP-AT command port:

```
+WEBSERVERRSP:1      // meaning that ESP32-C2 has received Wi-Fi connection_
↪information
WIFI CONNECTED        // meaning that ESP32-C2 is connecting
WIFI GOT IP           // meaning that ESP32-C2 connect successfully to the_
↪destination router
+WEBSERVERRSP:2      // meaning that STA device has received Wi-Fi connection_
↪result, and web resources can be released
```

Fig. 12: Wi-Fi Provisioning Interface

Fig. 13: Connection to the Router

Fig. 14: Getting Router Information

Fig. 15: Re-entering the Applet

Fig. 16: Connection to the Router via the Applet

Fig. 17: Successfully connection to the Router via the Applet

Fig. 18: Failed Connection to the Router via the Applet

5.If the ESP32-C2 fails to connect to the router, the page will display:

At the same time, the following messages will be returned from the ESP-AT command port:

```
+WEBSEVERRSP:1          // meaning that ESP32-C2 has received Wi-Fi connection_
↪information, but failed to connect to the router.
```

The target AP to be accessed is the hotspot provided by the mobile phone which loading the WeChat applet.

If the target AP to be accessed is the hotspot provided by the mobile phone which loading the WeChat applet, it is not necessary to enter the ssid, but only needs to enter the password of the AP, and turn on the mobile AP in time according to the prompts.

Note: To use this function, keep at least the first five bytes of the phone's Personal Hotspot MAC address the same as those of the WLAN MAC address.

1.Select the “Local phone hotspot” option box on the WeChat applet page, enter the password of the local hotspot, and click “Connect” .

Fig. 19: Entering the Password of the AP

2.After receiving the prompt “Connecting to the mobile phone hotspot” , please check that the local mobile phone hotspot is turned on. At this time, the ESP32-C2 will automatically scan the surrounding hotspots and initiate a

connection.

Fig. 20: Starting Connection to the AP

3. The display of the WiFi connection results on the applet page and the data output from the serial port are the same as the above-mentioned “The target AP to be accessed is not the hotspot provided by the mobile phone which loading the WeChat applet.”, please refer to the above.

Troubleshooting

Note 1: The Wi-Fi provisioning page received a prompt “Data transmission failed”. Please check whether the Wi-Fi AP of the ESP32-C2 is correctly turned on, and the relevant configuration of the AP, and confirm that the correct AT command has been entered to successfully enable the web server.

Note 2: The Wi-Fi provisioning page receives a prompt “Failed to connect to the AP”. Please check whether the Wi-Fi connection function of the mobile phone is turned on, check whether the Wi-Fi AP of the ESP32-C2 is correctly turned on, and whether the ssid and password of the AP are configured according to the above steps.

Note 3: The Wi-Fi provisioning page receives a prompt “The Wi-Fi provisioning saved by the system expired”. Please manually connect the ESP32-C2 AP with a mobile phone, and confirm that the ssid and password of the ESP32-C2 module have been configured according to the above steps.

4.4.4 OTA Firmware Upgrade Using a WeChat Applet

The WeChat applet support online firmware upgrade , please refer to the above-described [Configure ESP32-C2 Device Parameters](#) specific steps performed ESP32-C2 configuration (if the configuration has been completed, do not repeat configuration). Once configured, the device performs OTA firmware upgrade processes is similar as [OTA Firmware Upgrade Using a Browser](#) .

4.4.5 ESP32-C2 Using Captive Portal

Introduction

Captive Portal is commonly used to present a specified page to newly connected devices of a Wi-Fi or wired network. For more information about Captive Portal, please refer to [Captive Portal Wiki](#) .

Note: The default firmware does not support web server Captive Portal, you may enable it by `./build.py menuconfig>Component config>AT>AT WEB Server command support>AT WEB captive portal support` and build the project (see [Compile ESP-AT Project](#)). In addition, enabling this feature may cause page skipping when using wechat applet for Wi-Fi provisioning or OTA firmware upgrade. It is recommended that this feature be enabled only when accessing at web using browser.

Introduction to Operation Steps

After Enable Captive Portal support, please refer to [Use STA Device to Connect to ESP32-C2 Device](#) to complete the configuration of the ESP32-C2, and then connect to the AP of the ESP32-C2:

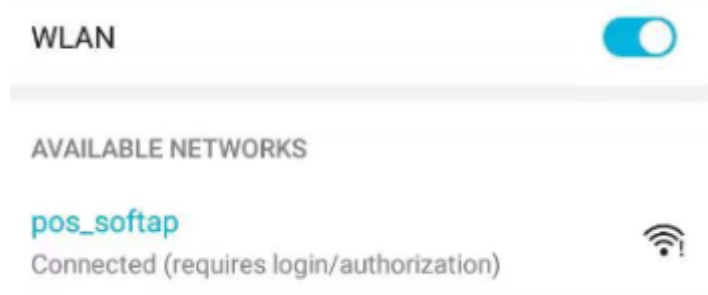

Fig. 21: Connection to the AP with Captive Portal Enabled

As shown in the figure above, after the Station device is connected to the AP of the ESP32-C2 with the Captive Portal function enabled, it will prompt “requires login/authentication” , and then the browser will automatically open and jump to the main interface of AT Web. If it cannot be redirected automatically, please follow the instructions of the Station device, click “Authentication” or click the name of the “pos_softap” hotspot in the figure above to manually trigger the Captive Portal to automatically open the browser and enter the main interface of AT Web.

Troubleshooting

Note 1: Both Station device and AP device support the Captive Portal function to ensure the normal use of this function. Therefore, if the device is connected to the AP of the ESP32-C2, but it does not prompt “Login/Authentication” , it may be that the Station device does not support this function. In this case, please refer to the specific steps of [Use the Browser to Send Wi-Fi Connection Information](#) above to open the main interface of AT Web.

4.5 HTTP AT Examples

This document provides detailed command examples to illustrate how to utilize *HTTP AT Commands* on ESP32-C2.

- *The HEAD method of HTTP client*
- *The GET method of HTTP client*
- *The POST method of HTTP client (suitable for POST small amount of data)*
- *The POST method of HTTP client (recommended method)*
- *The PUT method of HTTP client (suitable for no data put)*
- *The PUT method of HTTP client (recommended method)*
- *The DELETE method of HTTP client*

Important: Currently ESP-AT only supports some HTTP client functions.

4.5.1 The HEAD method of HTTP client

In this example, the HTTP server is <http://httpbin.org>.

1. Restore factory default settings of the module.

Command:

```
AT+RESTORE
```

Response:

```
OK
```

2. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

3. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.
4. Send an HTTP HEAD request. Set `opt` to 1 (HEAD method), `url` to `http://httpbin.org/get` and `transport_type` to 1 (HTTP_TRANSPORT_OVER_TCP).

Command:

```
AT+HTTPCLIENT=1,0,"http://httpbin.org/get",,,1
```

Response:

```
+HTTPCLIENT:35, Date: Sun, 26 Sep 2021 06:59:13 GMT
+HTTPCLIENT:30, Content-Type: application/json
+HTTPCLIENT:19, Content-Length: 329
+HTTPCLIENT:22, Connection: keep-alive
+HTTPCLIENT:23, Server: gunicorn/19.9.0
+HTTPCLIENT:30, Access-Control-Allow-Origin: *
+HTTPCLIENT:38, Access-Control-Allow-Credentials: true

OK
```

Note:

- The HTTP header information you obtain may be different from those in the above response.

4.5.2 The GET method of HTTP client

This example describes how to download an image file in JPG format. The image link is <https://www.espressif.com/sites/all/themes/espressif/images/about-us/solution-platform.jpg>.

1. Restore factory default settings of the module.

Command:

```
AT+RESTORE
```

Response:

```
OK
```

2. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

3. Connect to the router.

Command:

```
AT+CWJAP="espressif", "1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.
4. Send an HTTP GET request. Set opt to 2 (GET method), url to <https://www.espressif.com/sites/all/themes/espressif/images/about-us/solution-platform.jpg> and transport_type to 2 (HTTP_TRANSPORT_OVER_SSL).

Command:

```
AT+HTTPCLIENT=2,0,"https://www.espressif.com/sites/all/themes/espressif/images/
↪about-us/solution-platform.jpg",,,2
```

Response:

```
+HTTPCLIENT:512,<0xff><0xd8><0xff><0xe2><0x0c>XICC_PROFILE<break>
<0x01><0x01><break>
<break>
```

```

OK

4.5.3 The POST method of HTTP client (suitable for POST small amount of data)

In this example, the HTTP server is <http://httpbin.org> and the data type is `application/json`.

1. Restore factory default settings of the module.

Command:

```
AT+RESTORE
```

Response:

```
OK
```

2. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

3. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.
4. Send an HTTP POST request. Set `opt` to 3 (POST method), `url` to `http://httpbin.org/post`, `content-type` to 1 (application/json) and `transport_type` to 1 (HTTP_TRANSPORT_OVER_TCP).

Command:

```
AT+HTTPCLIENT=3,1,"http://httpbin.org/post",,,1,"{\"form\":{\"purpose\":\"test\
↪\"}}"
```

Response:

```
+HTTPCLIENT:282,{
  "args": {},
  "data": "{\"form\":{\"purpose\":\"test\"}}",
  "files": {},
  "form": {},
  "headers": {
    "Content-Length": "27",
    "Content-Type": "application/json",
    "Host": "httpbin.org",
    "User-Agent": "ESP32 HTTP Client/1.0",
    "X-Amzn-Trace-Id": "Root=
+HTTPCLIENT:173,1-61503a3f-4b16b71918855b97614c5dfb"
  },
  "json": {
    "form": {
      "purpose": "test"
    }
  },
  "origin": "20.187.154.207",
  "url": "http://httpbin.org/post"
}

OK
```

Note:

- The results you obtain may be different from those in the above response.

4.5.4 The POST method of HTTP client (recommended method)

If the amount of data you post is relatively large, and the length of a single AT command has exceeded the threshold of 256, it is recommended that you use the `AT+HTTPCPOST` command.

In this example, the HTTP server is <http://httpbin.org> and the data type is `application/json`.

1. Restore factory default settings of the module.

Command:

```
AT+RESTORE
```

Response:

```
OK
```

2. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

3. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP
OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

4. Post HTTP data of specified length. The command specifies that the number of HTTP header fields is 2, which are connection field and content-type field respectively. connection is keep-alive and content-type is application/json.

Assume the JSON data you want to post is of 427 bytes as follows.

```
{ "headers": { "Accept": "application/json", "Accept-Encoding": "gzip, deflate",
  ↳ "Accept-Language": "en-US,en;q=0.9,zh-CN;q=0.8,zh;q=0.7", "Content-Length": "0
  ↳ ", "Host": "httpbin.org", "Origin": "http://httpbin.org", "Referer": "http://
  ↳ httpbin.org/", "User-Agent": "Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.
  ↳ 36 (KHTML, like Gecko) Chrome/91.0.4472.114 Safari/537.36", "X-Amzn-Trace-Id
  ↳ ": "Root=1-6150581e-1ad4bd5254b4bf5218070413" } }
```

Command:

```
AT+HTTPCPOST="http://httpbin.org/post",427,2,"connection: keep-alive","content-
  ↳ type: application/json"
```

Response:

```
OK
```

```
>
```

This response indicates that AT is ready for receiving serial data. You should enter the 427-byte data mentioned above, and when the data length reaches the <length> value, data transmission starts.

```
+HTTPCPOST:281,{
  "args": {},
  "data": "{ \"headers\": { \"Accept\": \"application/json\", \"Accept-Encoding\
  ↳ \": \"gzip, deflate\", \"Accept-Language\": \"en-US,en;q=0.9,zh-CN;q=0.8,zh;
  ↳ q=0.7\", \"Content-Length\": \"0\", \"Host\": \"httpbin.org\", \"Origin\": \
  ↳ \"http://httpbin.org\", \"Referer\": \"htt
+HTTPCPOST:512,p://httpbin.org/\", \"User-Agent\": \"Mozilla/5.0 (X11; Linux
  ↳ x86_64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/91.0.4472.114 Safari/
  ↳ 537.36\", \"X-Amzn-Trace-Id\": \"Root=1-6150581e-1ad4bd5254b4bf5218070413\" } }
  ↳ ",
  "files": {},
  "form": {},
  "headers": {
```

(continues on next page)

(continued from previous page)

```

"Content-Length": "427",
"Content-Type": "application/json",
"Host": "httpbin.org",
"User-Agent": "ESP32 HTTP Client/1.0",
"X-Amzn-Trace-Id": "Root=1-61505e76-278b5c267aaf55842bd58b32"
},
"json": {
  "headers": {

+HTTPCPOST:512,"Accept": "application/json",
    "Accept-Encoding": "gzip, deflate",
    "Accept-Language": "en-US,en;q=0.9,zh-CN;q=0.8,zh;q=0.7",
    "Content-Length": "0",
    "Host": "httpbin.org",
    "Origin": "http://httpbin.org",
    "Referer": "http://httpbin.org/",
    "User-Agent": "Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.36 (KHTML,
→ like Gecko) Chrome/91.0.4472.114 Safari/537.36",
    "X-Amzn-Trace-Id": "Root=1-6150581e-1ad4bd5254b4bf5218070413"
  }
},
  "origin": "20.187.154
+HTTPCPOST:45,.207",
  "url": "http://httpbin.org/post"
}

SEND OK

```

Note:

- After AT outputs the > character, the special characters in the HTTP body do not need to be escaped using the escape character, and the data do not need to end with a new line (CR-LF).

4.5.5 The PUT method of HTTP client (suitable for no data put)

In this example, the HTTP server is <http://httpbin.org>. PUT request supports [Query String Parameters](#) mode.

1. Restore factory default settings of the module.

Command:

```
AT+RESTORE
```

Response:

```
OK
```

2. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

3. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.
4. Send an HTTP PUT request. Set `opt` to 4 (PUT method), `url` to `http://httpbin.org/put`, and `transport_type` to 1 (HTTP_TRANSPORT_OVER_TCP).
Command:

```
AT+HTTPCLIENT=4,0,"http://httpbin.org/put?user=foo",,,1
```

Response:

```
+HTTPCLIENT:282,{
  "args": {
    "user": "foo"
  },
  "data": "",
  "files": {},
  "form": {},
  "headers": {
    "Content-Length": "0",
    "Content-Type": "application/x-www-form-urlencoded",
    "Host": "httpbin.org",
    "User-Agent": "ESP32 HTTP Client/1.0",
    "X-Amzn-Trace-Id": "R
+HTTPCLIENT:140,oat=1-61503d41-1dd8cbe0056190f721ab1912"
  },
  "json": null,
  "origin": "20.187.154.207",
  "url": "http://httpbin.org/put?user=foo"
}

OK
```

Note:

- The results you obtain may be different from those in the above response.

4.5.6 The PUT method of HTTP client (recommended method)

In this example, the HTTP server is <http://httpbin.org> and the data type is `application/json`.

1. Restore factory default settings of the module.

Command:

```
AT+RESTORE
```

Response:

```
OK
```

2. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

3. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

4. PUT HTTP data of specified length. The command specifies that the number of HTTP header fields is 2, which are connection field and content-type field respectively. connection is keep-alive and content-type is application/json.

Assume the JSON data you want to post is of 427 bytes as follows.

```
{
  "headers": {
    "Accept": "application/json",
    "Accept-Encoding": "gzip, deflate",
    "Accept-Language": "en-US,en;q=0.9,zh-CN;q=0.8,zh;q=0.7",
    "Content-Length": "0",
    "Host": "httpbin.org",
    "Origin": "http://httpbin.org",
    "Referer": "http://httpbin.org/",
    "User-Agent": "Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/91.0.4472.114 Safari/537.36",
    "X-Amzn-Trace-Id": "Root=1-6150581e-1ad4bd5254b4bf5218070413"
  }
}
```

Command:

```
AT+HTTPCPUT="http://httpbin.org/put",427,2,"connection: keep-alive","content-type: application/json"
```

Response:

```
OK

>
```

This response indicates that AT is ready for receiving serial data. You should enter the 427-byte data mentioned above, and when the data length reaches the <length> value, data transmission starts.

```
+HTTPCPUT:281,{
  "args": {},
  "data": "{\n\"headers\": {\n\"Accept\": \"application/json\", \"Accept-Encoding\": \"gzip, deflate\", \"Accept-Language\": \"en-US,en;q=0.9,zh-CN;q=0.8,zh;q=0.7\", \"Content-Length\": \"0\", \"Host\": \"httpbin.org\", \"Origin\": \"http://httpbin.org\", \"Referer\": \"http://httpbin.org/\", \"User-Agent\": \"Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/91.0.4472.114 Safari/537.36\", \"X-Amzn-Trace-Id\": \"Root=1-6150581e-1ad4bd5254b4bf5218070413\"}\n}",
  "files": {},
  "form": {},
  "headers": {
    "Content-Length": "427",
    "Content-Type": "application/json",

    }
},
    "origin": "52.246.135
+HTTPCPU:43,.57",
    "url": "http://httpbin.org/put"
}

SEND OK

```

Note:

- After AT outputs the > character, the special characters in the HTTP body do not need to be escaped using the escape character, and the data do not need to end with a new line (CR-LF).

4.5.7 The DELETE method of HTTP client

In this example, the HTTP server is <http://httpbin.org>. The DELETE method is used to delete resources on a server. The exact use of DELETE requests depends on the server implementation.

1. Restore factory default settings of the module.

Command:

```
AT+RESTORE
```

Response:

```
OK
```

2. Set the Wi-Fi mode to station.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

3. Connect to the router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP
```

```
OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.
4. Send an HTTP DELETE request. Set opt to 5 (DELETE method), url to <http://httpbin.org/delete>, and transport_type to 1 (HTTP_TRANSPORT_OVER_TCP).

Command:

```
AT+HTTPCLIENT=5,0,"https://httpbin.org/delete",,,1
```

Response:

```
+HTTPCLIENT:282,{
  "args": {},
  "data": "",
  "files": {},
  "form": {},
  "headers": {
    "Content-Length": "0",
    "Content-Type": "application/x-www-form-urlencoded",
    "Host": "httpbin.org",
    "User-Agent": "ESP32 HTTP Client/1.0",
    "X-Amzn-Trace-Id": "Root=1-61504289-468a41
+HTTPCLIENT:114,737b0d251672acec9d"
  },
  "json": null,
  "origin": "20.187.154.207",
  "url": "https://httpbin.org/delete"
}

OK
```

Note:

- The results you obtain may be different from those in the above response.

4.6 Sleep AT Examples

This document provides an introduction and detailed command examples to illustrate how to utilize AT commands to set sleep modes on ESP32-C2 series of products.

- [Introduction](#)
- [Set Modem-sleep mode in Wi-Fi mode](#)
- [Set Light-sleep mode in Wi-Fi mode](#)
- [Set Deep-sleep mode](#)

4.6.1 Introduction

With the use of advanced power-management technologies, ESP32-C2 series can switch between different power modes. Currently, ESP-AT supports the following four power consumption modes (for more sleep modes, please refer to the datasheet):

1. **Active Mode:** CPU and chip radio are powered on. The chip can receive, transmit, or listen.
2. **Modem-sleep Mode:** The CPU is operational and the clock speed can be reduced. Wi-Fi baseband, Bluetooth LE baseband, and radio are disabled, but Wi-Fi and Bluetooth LE connection can remain active.
3. **Light-sleep Mode:** The CPU is paused. Any wake-up events (MAC, host, RTC timer, or external interrupts) will wake up the chip. Wi-Fi and Bluetooth LE connection can remain active.
4. **Deep-sleep Mode:** CPU and most peripherals are powered down. Only the RTC memory is powered on.

By default, ESP32-C2 will enter **Active** mode after system reset. When the CPU does not need to work all the time, such as waiting for external activities to wake up, the system can enter low-power modes.

For current consumption of ESP32-C2, please refer to [ESP32-C2 Series Datasheet](#).

Note:

- Setting ESP32-C2 to sleep modes in Wi-Fi mode and Bluetooth LE mode will be described separately.
- In single Wi-Fi mode, only station mode supports Modem-sleep mode and Light-sleep mode.

Measurement Method

In order to avoid some unnecessary interference during the power consumption test process, it is recommended to use the Espressif modules that integrate the chip for the test.

Refer to the following figure for hardware connection. (Note that the development board below only has the ESP32-C2 module on board, and all other peripheral components have been removed.)

Fig. 22: ESP32-C2 Hardware Connection

4.6.2 Set Modem-sleep mode in Wi-Fi mode

1. Set the Wi-Fi mode to station mode.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to an router.

Command:

```
AT+CWJAP="espressif","1234567890"
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Set the sleep mode to Modem-sleep mode.

Command:

```
AT+SLEEP=1
```

Response:

```
OK
```

Note:

- RF will be periodically closed according to AP DTIM (routers generally set DTIM to 1).
-

4.6.3 Set Light-sleep mode in Wi-Fi mode

1. Set the Wi-Fi mode to station mode.

Command:

```
AT+CWMODE=1
```

Response:

```
OK
```

2. Connect to an router. Set listen interval to 3.

Command:

```
AT+CWJAP="espressif","1234567890",,,3
```

Response:

```
WIFI CONNECTED
WIFI GOT IP

OK
```

Note:

- The SSID and password you entered may be different from those in the above command. Please replace the SSID and password with those of your router settings.

3. Set the sleep mode to Light-sleep mode.

Command:

```
AT+SLEEP=2
```

Response:

```
OK
```

Note:

- CPU will automatically sleep and RF will be periodically closed according to listen interval set by [AT+CWJAP](#).
-

4.6.4 Set Deep-sleep mode

1. Set the sleep mode to Deep-sleep mode. Set the deep-sleep time to 3600000 ms.

Command:

```
AT+GSLP=3600000
```

Response:

```
OK
```

Note:

- When the time is up, the device automatically wakes up, calls Deep-sleep wake stub, and then proceeds to load the application.
- For Deep-sleep mode, the only wake-up method is timed wake-up.

Chapter 5

How to Compile and Develop Your Own AT Project

5.1 Compile ESP-AT Project

This document details how to build your own ESP-AT project and flash the generated firmware into your ESP32-C2. It comes in handy when the [official released firmware](#) cannot meet your needs, for example, to customize the [AT port pins](#) and [partitions](#), and so on.

5.1.1 Detailed Steps

Please follow the detailed steps below to set up your environment and build the project. **It is recommended that you develop the esp-at project on Linux system.**

- [Step 1. Get Started with ESP-IDF](#)
- [Step 2. Get ESP-AT](#)
- [Step 3. Install Environment](#)
- [Step 4. Connect Your Device](#)
- [Step 5. Configure](#)
- [Step 6. Build the Project](#)
- [Step 7. Flash onto the Device](#)
- [build.py Advanced Usage](#)

5.1.2 Step 1. Get Started with ESP-IDF

Get started with ESP-IDF before compiling an ESP-AT project, because ESP-AT is developed based on ESP-IDF.

Please follow [ESP-IDF v5.0 Get Started](#) guide, configure, build, flash onto the ESP32-C2 device of the `hello_world` example.

Note: This step is not a must, but if you are a beginner, you are strongly recommended to complete it in order to familiarize yourself with ESP-IDF and ensure smooth proceeding with the following steps.

After you complete the ESP-IDF get started in the step above, now you can proceed to compile an ESP-AT project according to the following steps.

5.1.3 Step 2. Get ESP-AT

To compile an ESP-AT project, you need the software libraries provided by Espressif in the ESP-AT repository.

To get ESP-AT, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

- Linux or macOS

```
cd ~/esp
git clone --recursive https://github.com/espressif/esp-at.git
```

- Windows

For ESP32-C2 series of modules, it is recommended that you run [ESP-IDF 5.0 CMD](#) as an administrator first.

```
cd %userprofile%\esp
git clone --recursive https://github.com/espressif/esp-at.git
```

If you are located in China or have difficulties to access GitHub, you can also use `git clone https://gitee.com/EspressifSystems/esp-at.git` to get ESP-AT, which may be faster.

ESP-AT will be downloaded into `~/esp/esp-at` on Linux or macOS, or `%userprofile%\esp\esp-at` on Windows.

Note: This guide uses the directory `~/esp` on Linux or macOS, or `%userprofile%\esp` on Windows as an installation folder for ESP-AT. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-AT does not support spaces in paths.

5.1.4 Step 3. Install Environment

Run the project tool `install` to install the environment. This tool will automatically install Python packages, ESP-IDF repository, and the compiler and tools used by ESP-IDF.

- Linux or macOS

```
./build.py install
```

- Windows

```
python build.py install
```

Select the following configuration options for your ESP32-C2 if it is your first time.

- Select the `Platform` name for your ESP32-C2. For example, select `PLATFORM_ESP32C2` for ESP32-C2 series of products. `Platform` name is defined in [factory_param_data.csv](#).
- Select the `Module` name for your ESP32-C2. For example, select `ESP32C2-4MB` for the ESP8684-MINI-1 4MB module. `Module` name is defined in [factory_param_data.csv](#).
- Enable or disable `silence` mode. If enabled, it will remove some logs and reduce the firmware size. Generally, it should be disabled.
- The above three option items will not appear if the file `build/module_info.json` exists. So please delete it if you want to reconfigure the module information.

5.1.5 Step 4. Connect Your Device

Connect your ESP32-C2 device to the PC with a USB cable to download firmware and print log. See [Hardware Connection](#) for more information. Note that you do not need to set up the “AT command/response” connection if you do not send AT commands and receive AT responses during the compiling process. You can change default port pins referring to [How to Set AT Port Pins](#).

5.1.6 Step 5. Configure

Run the project configuration utility `menuconfig` to configure.

- Linux or macOS

```
./build.py menuconfig
```

- Windows

```
python build.py menuconfig
```

If the previous steps have been done correctly, the following menu pops up:

Fig. 1: Project configuration - Home window

You are using this menu to set up project-specific configuration, e.g. changing AT port pins, enabling Classic Bluetooth function, etc. If you made no changes, it will run with the default configuration.

5.1.7 Step 6. Build the Project

Build the project by running:

- Linux or macOS

```
./build.py build
```

- Windows

```
python build.py build
```

If Bluetooth feature is enabled, the firmware size will be much larger. Please make sure it does not exceed the OTA partition size.

After compiled, the combined factory bin will be created in `build/factory`. See [ESP-AT Firmware Differences](#) for more information.

5.1.8 Step 7. Flash onto the Device

Flash the firmware that you just compiled onto your ESP32-C2 by running:

- Linux or macOS

```
./build.py -p (PORT) flash
```

- Windows

```
python build.py -p (PORT) flash
```

Note that you need to replace (PORT) with your ESP32-C2's serial port name. Or you can follow the printed instructions to download the bin files into flash. Note that you also need to replace the (PORT).

If the ESP-AT bin fails to boot and prints “ota data partition invalid”, you should run `python build.py erase_flash` to erase the entire flash, and then reflash the AT firmware.

5.1.9 build.py Advanced Usage

The script `build.py` is based on `idf.py`, which means that all `idf.py <cmd>` features should be included in `build.py <cmd>`. You can run the following command for more details.

- Linux or macOS

```
./build.py --help
```

- Windows

```
python build.py --help
```

5.2 How to Set AT Port Pins

This document introduces how to modify *AT port* pins in the firmware for ESP32-C2 series of products. By default, ESP-AT uses two UART interfaces as AT ports: one is to output logs (named as log port below) and the other to send AT commands and receive responses (named as command port below).

To modify the AT port pins of your ESP32-C2, you should:

- *[clone the ESP-AT project](#)*;
- modify the pins either in the menuconfig utility or the `factory_param_data.csv` table;
- *[compile the project](#)* to generate the new bin in `build/customized_partitions/factory_param.bin`;
- *[flash the new bin to your device](#)*.

This document focuses on modifying the pins. Click the links above for details of other steps.

Note: To use other interfaces as the AT command port, please refer to [AT through SDIO](#), [AT through SPI](#), or [AT through socket](#) for more details.

5.2.1 ESP32-C2 Series

The log port and command port pins of ESP32-C2 AT firmware can be user-defined to other pins. Refer to [ESP32-C2 Technical Reference Manual](#) for the pins you can use.

Modify Log Port Pins

By default, the ESP32-C2 AT firmware provided by Espressif uses the following UART0 pins to output log:

- TX: GPIO21
- RX: GPIO20

When compiling your ESP-AT project, you can modify them to other pins with the menuconfig utility:

- `./build.py menuconfig -> Component config -> Common ESP-related -> UART for console output`
- `./build.py menuconfig -> Component config -> Common ESP-related -> UART TX on GPIO#`
- `./build.py menuconfig -> Component config -> Common ESP-related -> UART RX on GPIO#`

Modify Command Port Pins

By default, UART1 is used to send AT commands and receive AT responses, and its pins are defined in Column `uart_port`, `uart_tx_pin`, `uart_rx_pin`, `uart_cts_pin`, and `uart_rts_pin` of the [factory_param_data.csv](#).

You can change them directly in your `factory_param_data.csv` table:

- Open your local `factory_param_data.csv` file.
- Locate the row of your module.
- Set `uart_port` as needed.
- Set `uart_tx_pin` and `uart_rx_pin` as needed.
- Set `uart_cts_pin` and `uart_rts_pin` to be -1 if you do not use the hardware flow control function.
- Save the table.

5.3 How to add user-defined AT commands

This document details how to add a user-defined AT command based on the [ESP-AT](#) project. It uses the `AT+TEST` command as an example to show the sample code for each step.

Customizing a basic and well-functioned command requires at least the two steps below:

- [Define AT Commands](#)
- [Register AT Commands](#)

This step checks how the newly defined command works out.

- [Give it a try](#)

The remaining steps are for relatively complex AT commands and are optional depending on your needs.

- [Define Return Values](#)
- [Access Command Parameters](#)
- [Omit Command Parameters](#)
- [Block Command Execution](#)
- [Access Input Data from AT Command Port](#)

The source code of AT command set is not open-source, and is provided in the form of [library file](#). It is also the basis to parse user-defined AT commands.

5.3.1 Define AT Commands

Before defining any AT command, you should first decide on the name and type of the command.

Command naming rules:

- It should start with the `+` character.
- Alphabetic characters (`A~Z`, `a~z`), numeric characters (`0~9`), and some other characters (`!`, `%`, `-`, `.`, `/`, `:`, `_`) are supported. See [AT Command Types](#) for more information.

Command types:

Each AT command can have up to four types: Test Command, Query Command, Set Command, and Execute Command. See [AT Command Types](#) for more information.

Then, define desired type of command. Assuming that AT+TEST supports all the four types. Below is the sample code to define each type.

Test Command:

```
uint8_t at_test_cmd_test(uint8_t *cmd_name)
{
    uint8_t buffer[64] = {0};

    snprintf((char *)buffer, 64, "this cmd is test cmd: %s\r\n", cmd_name);

    esp_at_port_write_data(buffer, strlen((char *)buffer));

    return ESP_AT_RESULT_CODE_OK;
}
```

Query Command:

```
uint8_t at_query_cmd_test(uint8_t *cmd_name)
{
    uint8_t buffer[64] = {0};

    snprintf((char *)buffer, 64, "this cmd is query cmd: %s\r\n", cmd_name);

    esp_at_port_write_data(buffer, strlen((char *)buffer));

    return ESP_AT_RESULT_CODE_OK;
}
```

Set Command:

```
uint8_t at_setup_cmd_test(uint8_t para_num)
{
    int32_t para_int_1 = 0;
    uint8_t *para_str_2 = NULL;
    uint8_t num_index = 0;
    uint8_t buffer[64] = {0};

    if (esp_at_get_para_as_digit(num_index++, &para_int_1) != ESP_AT_PARA_PARSE_
↪RESULT_OK) {
        return ESP_AT_RESULT_CODE_ERROR;
    }

    if (esp_at_get_para_as_str(num_index++, &para_str_2) != ESP_AT_PARA_PARSE_
↪RESULT_OK) {
        return ESP_AT_RESULT_CODE_ERROR;
    }

    snprintf((char *)buffer, 64, "this cmd is setup cmd and cmd num is: %u\r\n",
↪para_num);
    esp_at_port_write_data(buffer, strlen((char *)buffer));

    memset(buffer, 0, 64);
    snprintf((char *)buffer, 64, "first parameter is: %d\r\n", para_int_1);
    esp_at_port_write_data(buffer, strlen((char *)buffer));

    memset(buffer, 0, 64);
    snprintf((char *)buffer, 64, "second parameter is: %s\r\n", para_str_2);
```

(continues on next page)

(continued from previous page)

```

    esp_at_port_write_data(buffer, strlen((char *)buffer));

    return ESP_AT_RESULT_CODE_OK;
}

```

Execute Command:

```

uint8_t at_exe_cmd_test(uint8_t *cmd_name)
{
    uint8_t buffer[64] = {0};

    snprintf((char *)buffer, 64, "this cmd is execute cmd: %s\r\n", cmd_name);

    esp_at_port_write_data(buffer, strlen((char *)buffer));

    return ESP_AT_RESULT_CODE_OK;
}

```

Finally, call `esp_at_cmd_struct` to define the name and type(s) that your AT command supports. The sample code below defined the name +TEST (omitting AT) and all the four types.

```

static esp_at_cmd_struct at_custom_cmd[] = {
    {"+TEST", at_test_cmd_test, at_query_cmd_test, at_setup_cmd_test, at_exe_cmd_
    ↪test},
};

```

If you do not want to define a particular type, set it to NULL.

5.3.2 Register AT Commands

Call API `esp_at_custom_cmd_array_regist()` to register your AT command. Below is the sample code to register AT+TEST:

```

esp_at_custom_cmd_array_regist(at_custom_cmd, sizeof(at_custom_cmd) / sizeof(at_
    ↪custom_cmd[0]));

```

Note: `esp_at_custom_cmd_array_regist` is recommended to be added to the `at_custom_init()` in `app_main()`.

5.3.3 Give it a try

If you have finished the above two steps, the command should work after you build the ESP-AT project and flash the firmware to your device. Give it a try!

Below is how AT+TEST works out.

Test Command:

```
AT+TEST=?
```

Response:

```

AT+TEST=?
this cmd is test cmd: +TEST

OK

```

Query Command:

```
AT+TEST?
```

Response:

```
AT+TEST?  
this cmd is query cmd: +TEST  
  
OK
```

Set Command:

```
AT+TEST=1,"espressif"
```

Response:

```
AT+TEST=1,"espressif"  
this cmd is setup cmd and cmd num is: 2  
first parameter is: 1  
second parameter is: espressif  
  
OK
```

Execute Command:

```
AT+TEST
```

Response:

```
AT+TEST  
this cmd is execute cmd: +TEST  
  
OK
```

5.3.4 Define Return Values

ESP-AT has defined return values in [esp_at_result_code_string_index](#). See [AT Messages](#) for more return values.

In addition to output return values through the return mode, you can also use API [esp_at_response_result\(\)](#) to output the execution result of the command. [ESP_AT_RESULT_CODE_SEND_OK](#) and [ESP_AT_RESULT_CODE_SEND_FAIL](#) can be used with the API in code.

For example, when you send data to the server or MCU with the Execute Command of AT+TEST, you can use [esp_at_response_result\(\)](#) to output the sending result, and the return mode to output the command execution result. Below is the sample code:

```
uint8_t at_exe_cmd_test(uint8_t *cmd_name)
{
    uint8_t buffer[64] = {0};

    snprintf((char *)buffer, 64, "this cmd is execute cmd: %s\r\n", cmd_name);

    esp_at_port_write_data(buffer, strlen((char *)buffer));

    // user-defined operation of sending data to server or MCU
    send_data_to_server();

    // output SEND OK
}
```

(continues on next page)

(continued from previous page)

```

    esp_at_response_result(ESP_AT_RESULT_CODE_SEND_OK);

    return ESP_AT_RESULT_CODE_OK;
}

```

How it works out:

```

AT+TEST
this cmd is execute cmd: +TEST

SEND OK

OK

```

5.3.5 Access Command Parameters

ESP-AT provides two APIs to access command parameters:

- `esp_at_get_para_as_digit()` obtains digital parameters.
- `esp_at_get_para_as_str()` obtains string parameters.

See [Set Command](#) for an example.

5.3.6 Omit Command Parameters

This section describes how to provide optional command parameters:

- *Omit the First or Middle Parameter*
- *Omit the Last Parameter*

Omit the First or Middle Parameter

Let's say you want to make `<param_2>` and `<param_3>` of `AT+TEST` optional. `<param_2>` is a digital parameter, and `<param_3>` a string parameter.

```
AT+TEST=<param_1>[,<param_2>][,<param_3>],<param_4>
```

Below is the sample code to achieve it:

```

uint8_t at_setup_cmd_test(uint8_t para_num)
{
    int32_t para_int_1 = 0;
    int32_t para_int_2 = 0;
    uint8_t *para_str_3 = NULL;
    uint8_t *para_str_4 = NULL;
    uint8_t num_index = 0;
    uint8_t buffer[64] = {0};
    esp_at_para_parse_result_type parse_result = ESP_AT_PARA_PARSE_RESULT_OK;

    snprintf((char *)buffer, 64, "this cmd is setup cmd and cmd num is: %u\r\n",
    ↪ para_num);
    esp_at_port_write_data(buffer, strlen((char *)buffer));

    parse_result = esp_at_get_para_as_digit(num_index++, &para_int_1);
    if (parse_result != ESP_AT_PARA_PARSE_RESULT_OK) {
        return ESP_AT_RESULT_CODE_ERROR;
    } else {

```

(continues on next page)

(continued from previous page)

```

        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "first parameter is: %d\r\n", para_int_1);
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }

    parse_result = esp_at_get_para_as_digit(num_index++, &para_int_2);
    if (parse_result != ESP_AT_PARA_PARSE_RESULT_OMITTED) {
        if (parse_result != ESP_AT_PARA_PARSE_RESULT_OK) {
            return ESP_AT_RESULT_CODE_ERROR;
        } else {
            // sample code
            // user needs to customize the operation
            memset(buffer, 0, 64);
            snprintf((char *)buffer, 64, "second parameter is: %d\r\n", para_int_
↪2);
            esp_at_port_write_data(buffer, strlen((char *)buffer));
        }
    } else {
        // sample code
        // the second parameter is omitted
        // user needs to customize the operation
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "second parameter is omitted\r\n");
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }

    parse_result = esp_at_get_para_as_str(num_index++, &para_str_3);
    if (parse_result != ESP_AT_PARA_PARSE_RESULT_OMITTED) {
        if (parse_result != ESP_AT_PARA_PARSE_RESULT_OK) {
            return ESP_AT_RESULT_CODE_ERROR;
        } else {
            // sample code
            // user needs to customize the operation
            memset(buffer, 0, 64);
            snprintf((char *)buffer, 64, "third parameter is: %s\r\n", para_str_3);
            esp_at_port_write_data(buffer, strlen((char *)buffer));
        }
    } else {
        // sample code
        // the third parameter is omitted
        // user needs to customize the operation
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "third parameter is omitted\r\n");
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }

    parse_result = esp_at_get_para_as_str(num_index++, &para_str_4);
    if (parse_result != ESP_AT_PARA_PARSE_RESULT_OK) {
        return ESP_AT_RESULT_CODE_ERROR;
    } else {
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "fourth parameter is: %s\r\n", para_str_4);
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }

    return ESP_AT_RESULT_CODE_OK;
}

```

Note: If the string parameter input is "", it is not omitted.

Omit the Last Parameter

Let's say you want to make the string parameter <param_3> of AT+TEST optional, which is also the last parameter.

```
AT+TEST=<param_1>,<param_2>[,<param_3>]
```

There are two cases of omission:

- AT+TEST=<param_1>,<param_2>
- AT+TEST=<param_1>,<param_2>,

Below is the sample code to achieve it:

```
uint8_t at_setup_cmd_test(uint8_t para_num)
{
    int32_t para_int_1 = 0;
    uint8_t *para_str_2 = NULL;
    uint8_t *para_str_3 = NULL;
    uint8_t num_index = 0;
    uint8_t buffer[64] = {0};
    esp_at_para_parse_result_type parse_result = ESP_AT_PARA_PARSE_RESULT_OK;

    snprintf((char *)buffer, 64, "this cmd is setup cmd and cmd num is: %u\r\n",
    ↪ para_num);
    esp_at_port_write_data(buffer, strlen((char *)buffer));

    parse_result = esp_at_get_para_as_digit(num_index++, &para_int_1);
    if (parse_result != ESP_AT_PARA_PARSE_RESULT_OK) {
        return ESP_AT_RESULT_CODE_ERROR;
    } else {
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "first parameter is: %d\r\n", para_int_1);
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }

    parse_result = esp_at_get_para_as_str(num_index++, &para_str_2);
    if (parse_result != ESP_AT_PARA_PARSE_RESULT_OK) {
        return ESP_AT_RESULT_CODE_ERROR;
    } else {
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "second parameter is: %s\r\n", para_str_2);
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }

    if (num_index == para_num) {
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "third parameter is omitted\r\n");
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    } else {
        parse_result = esp_at_get_para_as_str(num_index++, &para_str_3);
        if (parse_result != ESP_AT_PARA_PARSE_RESULT_OMITTED) {
            if (parse_result != ESP_AT_PARA_PARSE_RESULT_OK) {
                return ESP_AT_RESULT_CODE_ERROR;
            } else {
                // sample code
                // user needs to customize the operation
                memset(buffer, 0, 64);
                snprintf((char *)buffer, 64, "third parameter is: %s\r\n", para_
    ↪ str_3);
                esp_at_port_write_data(buffer, strlen((char *)buffer));
            }
        } else {
            // sample code
        }
    }
}
```

(continues on next page)

(continued from previous page)

```

        // the third parameter is omitted
        // user needs to customize the operation
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "third parameter is omitted\r\n");
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }
}

return ESP_AT_RESULT_CODE_OK;
}

```

Note: If the string parameter input is "", it is not omitted.

5.3.7 Block Command Execution

Sometimes you want to block the execution of one command to wait for another execution result, and the system may return different values according to the result.

Generally, this kind of command needs to synchronize the results of other tasks.

semaphore is recommended to handle synchronization.

The sample code is as follows:

```

xSemaphoreHandle at_operation_sema = NULL;

uint8_t at_exe_cmd_test(uint8_t *cmd_name)
{
    uint8_t buffer[64] = {0};

    snprintf((char *)buffer, 64, "this cmd is execute cmd: %s\r\n", cmd_name);

    esp_at_port_write_data(buffer, strlen((char *)buffer));

    // sample code
    // users don't have to create semaphores here
    at_operation_sema = xSemaphoreCreateBinary();
    assert(at_operation_sema != NULL);

    // block command execution
    // wait for another execution result
    // other tasks can call xSemaphoreGive to release the semaphore
    xSemaphoreTake(at_operation_sema, portMAX_DELAY);

    return ESP_AT_RESULT_CODE_OK;
}

```

5.3.8 Access Input Data from AT Command Port

ESP-AT supports accessing input data from AT Command port. It provides two APIs for this purpose.

- `esp_at_port_enter_specific()` sets the callback function which will be called by AT port after receiving the input data.
- `esp_at_port_exit_specific()` deletes the callback function set by `esp_at_port_enter_specific`.

Approaches to access the data vary depending on whether the data length has been specified or not.

Input Data of Specified Length

Assuming that you have specified the data length in <param_1> as follows:

AT+TEST=<param_1>

Below is the sample to access the input data of <param_1> length from AT Command Port:

```
static xSemaphoreHandle at_sync_sema = NULL;

void wait_data_callback(void)
{
    xSemaphoreGive(at_sync_sema);
}

uint8_t at_setup_cmd_test(uint8_t para_num)
{
    int32_t specified_len = 0;
    int32_t received_len = 0;
    int32_t remain_len = 0;
    uint8_t *buf = NULL;
    uint8_t buffer[64] = {0};

    if (esp_at_get_para_as_digit(0, &specified_len) != ESP_AT_PARA_PARSE_RESULT_
    OK) {
        return ESP_AT_RESULT_CODE_ERROR;
    }

    buf = (uint8_t *)malloc(specified_len);
    if (buf == NULL) {
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "malloc failed\r\n");
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }

    // sample code
    // users don't have to create semaphores here
    if (!at_sync_sema) {
        at_sync_sema = xSemaphoreCreateBinary();
        assert(at_sync_sema != NULL);
    }

    // output input prompt ">"
    esp_at_port_write_data((uint8_t *)>, strlen(">"));

    // set the callback function which will be called by AT port after receiving
    the input data
    esp_at_port_enter_specific(wait_data_callback);

    // receive input data
    while(xSemaphoreTake(at_sync_sema, portMAX_DELAY)) {
        received_len += esp_at_port_read_data(buf + received_len, specified_len -
        received_len);

        if (specified_len == received_len) {
            esp_at_port_exit_specific();

            // get the length of the remaining input data
            remain_len = esp_at_port_get_data_length();
            if (remain_len > 0) {
                // sample code
                // if the remaining data length > 0, the actual input data length
                is greater than the specified received data length
            }
        }
    }
}
```

(continues on next page)

(continued from previous page)

```

        // users can customize the operation to process the remaining data
        // here is just a simple print out of the remaining data
        esp_at_port_rcv_data_notify(remain_len, portMAX_DELAY);
    }

    // sample code
    // output received data
    memset(buffer, 0, 64);
    snprintf((char *)buffer, 64, "\r\nreceived data is: ");
    esp_at_port_write_data(buffer, strlen((char *)buffer));

    esp_at_port_write_data(buf, specified_len);

    break;
}
}

free(buf);

return ESP_AT_RESULT_CODE_OK;
}

```

So, if you set AT+TEST=5 and the input data is 1234567890, the ESP-AT output is as follows.

```

AT+TEST=5
>67890
received data is: 12345
OK

```

Input Data of Unspecified Length

This scenario is similar to the Wi-Fi *Passthrough Mode*. You do not specify the data length.

```
AT+TEST
```

Assuming that ESP-AT ends the execution of the command and returns the execution result, the sample code is as follows:

```

#define BUFFER_LEN (2048)
static xSemaphoreHandle at_sync_sema = NULL;

void wait_data_callback(void)
{
    xSemaphoreGive(at_sync_sema);
}

uint8_t at_exe_cmd_test(uint8_t *cmd_name)
{
    int32_t received_len = 0;
    int32_t remain_len = 0;
    uint8_t *buf = NULL;
    uint8_t buffer[64] = {0};

    buf = (uint8_t *)malloc(BUFFER_LEN);
    if (buf == NULL) {
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "malloc failed\r\n");
        esp_at_port_write_data(buffer, strlen((char *)buffer));
    }
}

```

(continues on next page)

(continued from previous page)

```

}

// sample code
// users don't have to create semaphores here
if (!at_sync_sema) {
    at_sync_sema = xSemaphoreCreateBinary();
    assert(at_sync_sema != NULL);
}

// output input prompt ">"
esp_at_port_write_data((uint8_t *)>", strlen(">"));

// set the callback function which will be called by AT port after receiving
the input data
esp_at_port_enter_specific(wait_data_callback);

// receive input data
while(xSemaphoreTake(at_sync_sema, portMAX_DELAY)) {
    memset(buf, 0, BUFFER_LEN);

    received_len = esp_at_port_read_data(buf, BUFFER_LEN);
    // check whether to exit the mode
    // the exit condition is the "+++" string received
    if ((received_len == 3) && (strcmp((const char *)buf, "+++", 3) == 0) {
        esp_at_port_exit_specific();

        // sample code
        // if the remaining data length > 0, it means that there is still data
        left in the buffer to be processed
        // users can customize the operation to process the remaining data
        // here is just a simple print out of the remaining data
        remain_len = esp_at_port_get_data_length();
        if (remain_len > 0) {
            esp_at_port_recv_data_notify(remain_len, portMAX_DELAY);
        }

        break;
    } else if (received_len > 0) {
        // sample code
        // users can customize the operation to process the received data
        // here is just a simple print received data
        memset(buffer, 0, 64);
        snprintf((char *)buffer, 64, "\r\nreceived data is: ");
        esp_at_port_write_data(buffer, strlen((char *)buffer));

        esp_at_port_write_data(buf, strlen((char *)buf));
    }
}

free(buf);

return ESP_AT_RESULT_CODE_OK;
}

```

So, if the first input data is 1234567890, and the second input data is +++, the ESP-AT output is as follows:

```

AT+TEST
>
received data is: 1234567890
OK

```

5.4 How to Improve ESP-AT Throughput Performance

By default, UART is used for communication between ESP-AT and the host MCU, so the maximum throughput speed will not exceed its default configuration, that is, 115200 bps. If users want ESP-AT to achieve high throughput, it is necessary to understand this document and choose the appropriate configuration method. Taking ESP32-C2 as an example, this document introduces how to improve the throughput performance of ESP-AT.

Note: This document describes general methods to improve TCP/UDP/SSL throughput performance when ESP-AT is in *Passthrough Mode*.

Users could choose one of the following methods to improve throughput performance:

- [\[Simple\] Quick Configuration](#)
- [\[Recommended\] Understand Data Stream and Make the Precise Configuration](#)

5.4.1 [Simple] Quick Configuration

1. Configure system, LWIP, Wi-Fi parameters

Copy the following code snippet and append to tail of `module_config/module_esp32c2_default/sdkconfig.defaults` file. For other ESP32-C2 series devices, please modify the `sdkconfig.defaults` file in the corresponding folder.

```
# System
CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE=4096
CONFIG_FREERTOS_UNICORE=n
CONFIG_FREERTOS_HZ=1000
CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_120=y
CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ=120
CONFIG_ESPTOOLPY_FLASHMODE_QIO=y
CONFIG_ESPTOOLPY_FLASHFREQ_60M=y

# LWIP
CONFIG_LWIP_TCP_SND_BUF_DEFAULT=65534
CONFIG_LWIP_TCP_WND_DEFAULT=65534
CONFIG_LWIP_TCP_RECVMBOX_SIZE=12
CONFIG_LWIP_UDP_RECVMBOX_SIZE=12
CONFIG_LWIP_TCPIP_RECVMBOX_SIZE=64

# Wi-Fi
CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM=16
CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM=64
CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM=64
CONFIG_ESP32_WIFI_TX_BA_WIN=32
CONFIG_ESP32_WIFI_RX_BA_WIN=32
CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED=y
CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED=y
```

2. Enlarge UART buffer size

Copy the following code snippet and replace the `uart_driver_install()` line of `at_uart_task.c` file.

```
uart_driver_install(esp_at_uart_port, 1024 * 16, 1024 * 16, 100, &esp_at_
↪uart_queue, 0);
```

3. Delete, Build, Flash, Run

```
rm -rf build sdkconfig
./build.py build
./build.py flash monitor
```

4. Increase UART baud rate before entering passthrough mode

A typical ESP-AT commands sequence is as follows:

```
AT+CWMODE=1
AT+CWJAP="ssid","password"
AT+UART_CUR=3000000,8,1,0,3
AT+CIPSTART="TCP","192.168.105.13",3344
AT+CIPSEND
// data transmission
```

This simple and quick configuration method can improve the throughput to a certain extent, but sometimes it might not meet the expectations of users. In addition, some configurations may not hit the bottleneck of throughput. Higher configurations may sacrifice memory resources or power consumption. Therefore, users could also familiarize themselves with the following recommended method and make the precise configuration.

5.4.2 [Recommended] Understand Data Stream and Make the Precise Configuration

The factors that generally affect ESP-AT throughput are illustrated in the following figure:

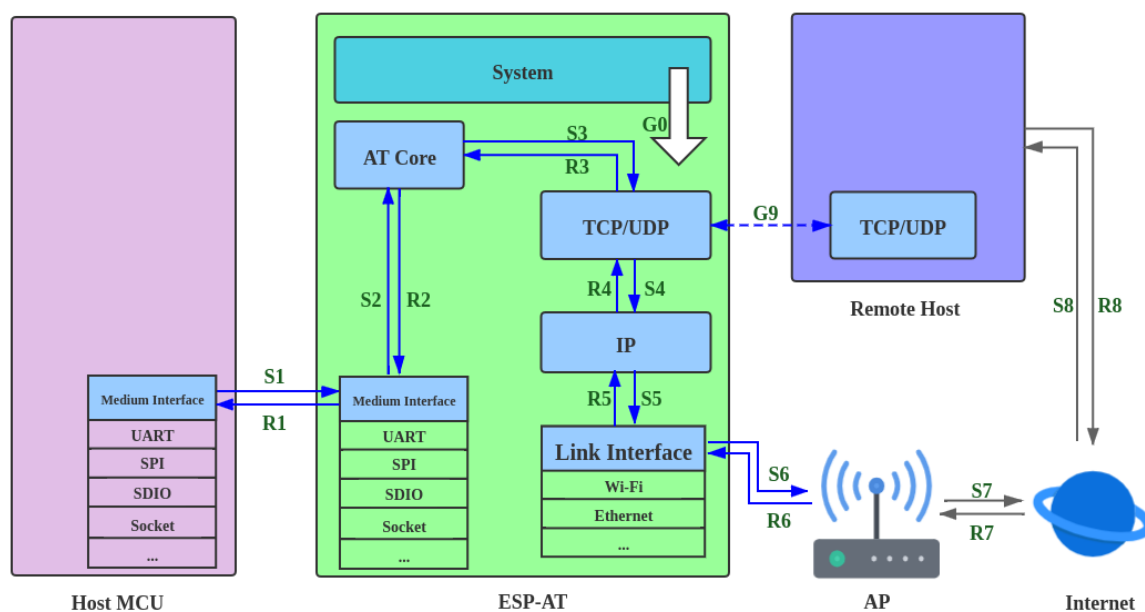

Fig. 2: Data Stream in Throughput

As shown by the arrows in the figure:

- The Data stream sent by ESP-AT is (TX): S1 -> S2 -> S3 -> S4 -> S5 -> S6 -> S7 -> S8
- The Data stream received by ESP-AT is (RX): R8 -> R7 -> R6 -> R5 -> R4 -> R3 -> R2 -> R1

The data stream of throughput is similar to water flow. In order to improve throughput, it is necessary to consider optimizing between nodes with low data flow rate rather than making additional configuration between nodes with expected data flow rate, so as to avoid unnecessary waste of resources. In actual products, usually, users only need to improve the throughput of one data stream. So here, users need to configure it according to the following instructions.

Note: The following configurations are based on sufficient available memory. Users can query the available memory through the AT command: [AT+SYSRAM](#).

1. G0 throughput optimization

G0 is a part of the system that can be optimized. The recommended configuration is as follows:

```
CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE=4096
CONFIG_FREERTOS_UNICORE=n
CONFIG_FREERTOS_HZ=1000
CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_120=y
CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ=120
CONFIG_ESPTOOLPY_FLASHMODE_QIO=y
CONFIG_ESPTOOLPY_FLASHFREQ_60M=y
```

2. S1, R1 throughput optimization

Generally, S1 and R1 are the key to the throughput of ESP-AT. Because UART is used for communication between ESP-AT and the host MCU by default, and the baud rate is 115200. On the hardware, the baud rate upper limit is 5 Mbps. Therefore, if the throughput is expected to be less than 5 Mbps, the user can use the default UART as the communication medium with the host MCU, and the following optimization methods can be carried out.

2.1 Enlarge UART buffer size

Copy the following code snippet and replace the `uart_driver_install()` line of `at_uart_task.c` file.

- Improve UART TX throughput

```
uart_driver_install(esp_at_uart_port, 1024 * 16, 8192, 100, &esp_at_
↳uart_queue, 0);
```

- Improve UART RX throughput

```
uart_driver_install(esp_at_uart_port, 2048, 1024 * 16, 100, &esp_at_
↳uart_queue, 0);
```

- Improve UART TX and RX throughput

```
uart_driver_install(esp_at_uart_port, 1024 * 16, 1024 * 16, 100, &esp_
↳at_uart_queue, 0);
```

2.2 Increase UART baud rate before entering passthrough mode

A typical ESP-AT commands sequence is as follows:

```
AT+CWMODE=1
AT+CWJAP="ssid","password"
AT+UART_CUR=3000000,8,1,0,3
AT+CIPSTART="TCP","192.168.105.13",3344
AT+CIPSEND
// data transmission
```

Note: The user needs to ensure that the UART of the host MCU can support such a high rate, and the UART connection between the host MCU and ESP-AT is as short as possible.

Note: If the user expects the throughput rate to be greater than or close to 5 Mbps, then SPI, SDIO, Socket or other methods can be considered. Please refer to:

- Socket: [Socket AT Guide](#)

3. S2, R2, R3, S3 throughput optimization

Generally, S2, R2, R3, S3 are not the bottleneck of ESP-AT throughput. Because AT core transfers data between UART buffer and the transport layer of communication protocol, where has minimal and non-time-consuming application logic, there is no need to optimize them.

4. S4, R4, S5, R5, S6, R6 throughput optimization

If UART is used for communication between ESP-AT and host MCU, S4, R4, S5, R5, S6, R6 need not be optimized. If other transmission media are used, S4, R4, S5, R5, S6, R6 should be a factor affecting throughput.

S4, R4, S5, R5, S6, R6 is the data stream between the transport layer, network layer and data link layer of the communication protocol. Users need to read [How to improve Wi-Fi performance](#) in ESP-IDF to understand the principle and make reasonable configuration. These configurations can be configured in `./build.py menuconfig`.

- Improve throughput of S4 -> S5 -> S6: [TX direction](#)
- Improve throughput of R6 -> R5 -> R4: [RX direction](#)

5. S6, R6 throughput optimization

S6 and R6 are the data link layers of the communication protocol. ESP32-C2 can use Wi-Fi or ethernet as the transmission medium. In addition to the optimization methods described above, Wi-Fi throughput optimization may also need users' attention:

- Improve RF Power
The default RF power is usually not the bottleneck of throughput. Users could query and set RF power through AT command: [AT+RFPower](#).
- Set 802.11 b/g/n protocol
The default Wi-Fi mode is 802.11 b/g/n protocol. Users could query and set 802.11 b/g/n protocol through AT command: [AT+CWSTAPROTO](#). The configuration is bidirectional. Therefore, it is recommended that the Wi-Fi mode of AP is configured as 802.11 b/g/n protocol and the bandwidth mode of AP is configured as HT20/HT40 (20/40 MHz) mode.

6. S7, R7, S8, R8 throughput optimization

Generally, S7, R7, S8, R8 are not the scope of ESP-AT throughput optimization because this is related to the actual network bandwidth, network routing, physical distance, etc.

5.5 How to Generate Factory Parameter Bin

This document explains how to generate a customized ESP-AT factory parameter bin file (factory_MODULE_NAME.bin) for your module. For example, you may want to self-define the country code, RF restriction, or UART pins in your ESP-AT firmware. The two tables below allow you to define such parameters.

- [factory_param_type.csv](#)
- [factory_param_data.csv](#)

The following describes how to generate a customized factory parameter bin by modifying the two tables.

- [Add a Customized Module](#)
- [Add a Customized Parameter](#)
- [Modify Factory Parameter Data on an Existing Module](#)

5.5.1 factory_param_type.csv

The factory_param_type.csv table lists all the parameters that you can define as well as the offset, type, and size of each parameter. It is located in [customized_partitions/raw_data/factory_param/factory_param_type.csv](#).

The table below provides some information about each parameter.

param_name	Note
description	Additional information of the module, which is prompted when you are building the ESP-AT project.
magic_flag	The value must be 0xfcfcc.
version	The version of factory parameter management for internal use. The current version is 3. It is not recommended to modify it.
reserved1	Reserved.
tx_max_power	Wi-Fi maximum tx power for ESP32-C2: [40,84]. See ESP32-C2 tx power setting range for details.
uart_port	The UART port that is used to send AT commands and receive AT responses.
start_channel	Wi-Fi start channel.
channel_num	The total channel number of Wi-Fi.
country_code	Country code.
uart_baudrate	UART baudrate.
uart_tx_pin	UART tx pin.
uart_rx_pin	UART rx pin.
uart_cts_pin	UART cts pin; it should be set to -1 if not used.
uart_rts_pin	UART rts pin; it should be set to -1 if not used.
tx_control_pin	For some boards, the tx pin needs to be separated from MCU when power on; it should be set to -1 if not used.
rx_control_pin	For some boards, the rx pin needs to be separated from MCU when power on; it should be set to -1 if not used.
reserved2	Reserved.
platform	The platform (or called chip series) that the current firmware runs on.
module_name	The module that the current firmware runs on.

5.5.2 factory_param_data.csv

This factory_param_data.csv table holds the values for all the parameters defined in [factory_param_type.csv](#). It covers the modules of ESP32-C2 series. You can customize your factory parameter bin by modifying the values in the table. It is located in [customized_partitions/raw_data/factory_param/factory_param_data.csv](#).

5.5.3 Add a Customized Module

This section demonstrates how to add a customized module in factory_param_data.csv and generate the factory parameter bin for it with an example. Assuming that you want to generate the factory parameter bin for an ESP32-C2 module named as MY_MODULE, its country code is JP, Wi-Fi channel is from 1 to 14, and other parameters stay the same with ESP32C2-4MB module of PLATFORM_ESP32C2, you can do as follows:

- [Modify factory_param_data.csv](#)
- [Modify esp_at_module_info Structure](#)
- [Recompile the Project and Select the Customized Module](#)

Modify factory_param_data.csv

Set all parameter values for MY_MODULE in the factory_param_data.csv table.

Firstly, insert a row at the bottom of the table, and then enter the following parameter values:

- param_name: value
- platform: PLATFORM_ESP32C2
- module_name: MY_MODULE

- description: MY_DESCRIPTION
- magic_flag: 0xfcfc
- version: 3
- reserved1: 0
- tx_max_power: 78
- uart_port: 1
- start_channel: 1
- channel_num: 14
- country_code: JP
- uart_baudrate: 115200
- uart_tx_pin: 17
- uart_rx_pin: 16
- uart_cts_pin: 15
- uart_rts_pin: 14
- tx_control_pin: -1
- rx_control_pin: -1

The modified factory_param_data.csv file is as follows.

```
platform,module_name,description,magic_flag,version,reserved1,tx_max_power,uart_
↪port,start_channel,channel_num,country_code,uart_baudrate,uart_tx_pin,uart_rx_
↪pin,uart_cts_pin,uart_rts_pin,tx_control_pin,rx_control_pin
PLATFORM_ESP32,WROOM-32,,0xfcfc,3,0,78,1,1,13,CN,115200,17,16,15,14,-1,-1
...
PLATFORM_ESP32C2,MY_MODULE,MY_DESCRIPTION,0xfcfc,3,0,78,1,1,14,JP,115200,17,16,15,
↪14,-1,-1
```

Modify esp_at_module_info Structure

Add customized module information in the esp_at_module_info structure in [at/src/at_default_config.c](#).

The esp_at_module_info structure provides OTA upgrade verification token:

```
typedef struct {
    char* module_name;
    char* ota_token;
    char* ota_ssl_token;
} esp_at_module_info_t;
```

If you do not want to use OTA features, member 2 ota_token and member 3 ota_ssl_token should be set to NULL. Member 1 module_name must correspond to the field module_name in the factory_param_data.csv file.

The modified esp_at_module_info structure is as follows:

```
static const esp_at_module_info_t esp_at_module_info[] = {
    #if defined(CONFIG_IDF_TARGET_ESP32)
    ...
    #endif

    #if defined(CONFIG_IDF_TARGET_ESP32C3)
    ...
    #endif

    #if defined(CONFIG_IDF_TARGET_ESP32C2)
    ...
    #endif

    #if defined(CONFIG_IDF_TARGET_ESP32C2)
    { "MY_MODULE", CONFIG_ESP_AT_OTA_TOKEN_MY_MODULE, CONFIG_ESP_AT_OTA_
    ↪SSL_TOKEN_MY_MODULE }, // MY_MODULE
```

(continues on next page)

(continued from previous page)

```
#endif
};
```

Macro `CONFIG_ESP_AT_OTA_TOKEN_MY_MODULE` and macro `CONFIG_ESP_AT_OTA_SSL_TOKEN_MY_MODULE` are defined in the header file [at/private_include/at_ota_token.h](#).

```
#if defined(CONFIG_IDF_TARGET_ESP32C2)
...
#define CONFIG_ESP_AT_OTA_TOKEN_MY_MODULE          CONFIG_ESP_AT_OTA_TOKEN_DEFAULT

...
#define CONFIG_ESP_AT_OTA_SSL_TOKEN_MY_MODULE      CONFIG_ESP_AT_OTA_SSL_TOKEN_
↪DEFAULT
```

Recompile the Project and Select the Customized Module

After adding the customized module information, recompile the whole project according to [Compile ESP-AT Project](#) and select the customized module when configuring the project:

```
Platform name:
1. PLATFORM_ESP32
2. PLATFORM_ESP32C3
3. PLATFORM_ESP32C2
choose(range[1, 3]):3

Module name:
...
x. MY_MODULE (description: MY_DESCRIPTION)
choose(range[1, x]):x
```

You can find the factory parameter bin generated in `esp-at/build/customized_partitions` folder after the build is completed.

5.5.4 Add a Customized Parameter

This section demonstrates how to add a customized parameter with an example. Assuming that you want to add the parameter `date` for `MY_MODULE` and set it to `20210603`, you should do as follows:

- [Modify factory_param_type.csv](#)
- [Modify factory_param_data.csv](#)
- [Process a Customized Parameter](#)
- [Recompile the Project](#)

Modify factory_param_type.csv

Define the parameter `date` in the `factory_param_type.csv`.

Firstly, insert a row at the end of the table, and then set the name, offset, type, and size of the parameter:

param_name	offset	type	size
description	-1	String	0
...
date	88	String	9

Modify factory_param_data.csv

In the factory_param_data.csv, insert a column named as date to the right of the last column, then set its value to 20210603 for MY_MODULE.

The modified CSV table is as follows:

```
platform,module_name,description,magic_flag,version,reserved1,tx_max_power,uart_
↳port,start_channel,channel_num,country_code,uart_baudrate,uart_tx_pin,uart_rx_
↳pin,uart_cts_pin,uart_rts_pin,tx_control_pin,rx_control_pin,date
PLATFORM_ESP32,WROOM-32,,0xfcfc,3,0,78,1,1,13,CN,115200,17,16,15,14,-1,-1
...
PLATFORM_ESP32C2,MY_MODULE,MY_DESCRIPTION,0xfcfc,3,0,78,1,1,14,JP,115200,17,16,15,
↳14,-1,-1,20210603
```

Process a Customized Parameter

You can customize processing functions to process the customized parameter date. This section is just a simple output:

```
static void esp_at_factory_parameter_date_init(void)
{
    const esp_partition_t * partition = esp_at_custom_partition_find(0x40, 0xff,
↳"factory_param");
    char* data = NULL;
    char* str_date = NULL;

    if (!partition) {
        printf("factory_parameter partition missed\r\n");
        return;
    }

    data = (char*)malloc(ESP_AT_FACTORY_PARAMETER_SIZE); // Notes
    assert(data != NULL);
    if(esp_partition_read(partition, 0, data, ESP_AT_FACTORY_PARAMETER_SIZE) !=_
↳ESP_OK) {
        free(data);
        return;
    }

    if ((data[0] != 0xFC) || (data[1] != 0xFC)) { // check magic flag, should be_
↳0xfc 0xfc
        return;
    }

    // sample code
    // users can customize the operation of processing date
    // here is just a simple print out of the date parameter
    str_date = &data[88]; // date field offset address
    printf("date is %s\r\n", str_date);

    free(data);

    return;
}
```

Recompile the Project

Recompile the whole project according to *Compile ESP-AT Project*.

You can find the factory parameter bin generated in `esp-at/build/customized_partitions` folder after the build is completed.

5.5.5 Modify Factory Parameter Data on an Existing Module

Assuming that you need to modify the factory parameter data of an existing module in `factory_param_data.csv`, you choose one of the following options:

- *Recompile the Whole Project*
- *Only Recompile the Factory Parameter Bin*
- *Directly Modify Factory Parameter Bin*

Recompile the Whole Project

Open the `factory_param_data.csv` and modify the parameters as needed.

Recompile the ESP-AT project according to [Compile ESP-AT Project](#) to generate the factory parameter bin in `esp-at/build/customized_partitions` folder.

Only Recompile the Factory Parameter Bin

Firstly, clone the entire ESP-AT project.

Secondly, navigate to the root directory of ESP-AT project, enter the following command, and replace some parameters:

```
python tools/factory_param_generate.py --platform PLATFORM --module MODULE --
↪define_file DEFINE_FILE --module_file MODULE_FILE --bin_name BIN_NAME --log_file_
↪LOG_FILE
```

- Replace `PLATFORM` with the platform of your module. It must correspond to the `platform` in the `factory_param_data.csv`.
- Replace `MODULE` with your module name. It must correspond to the `module_name` in the `factory_param_data.csv`.
- Replace `DEFINE_FILE` with the relative path of `factory_param_type.csv`.
- Replace `MODULE_FILE` with the relative path of `factory_param_data.csv`.
- Replace `BIN_NAME` with factory parameter bin file name.
- Replace `LOG_FILE` with the file name stored the module name.

Below is the example command for `MY_MODULE`:

```
python tools/factory_param_generate.py --platform PLATFORM_ESP32C2 --module MY_
↪MODULE --define_file components/customized_partitions/raw_data/factory_param/
↪factory_param_type.csv --module_file components/customized_partitions/raw_data/
↪factory_param/factory_param_data.csv --bin_name ./factory_param.bin --log_file ./
↪factory_parameter.log
```

After the above command is executed, the three files will be generated in the current directory:

- `factory_param.bin`
- `factory_parameter.log`
- `factory_param_MY_MODULE.bin`

Download the new `factory_param_MY_MODULE.bin` into flash. ESP-AT provides [esptool.py](#) to do it. Execute the following command under the root directory of ESP-AT project and replace some parameters:

```
python esp-idf/components/esptool_py/esptool/esptool.py -p PORT -b BAUD --before_
↪default_reset --after hard_reset --chip auto write_flash --flash_mode dio --
↪flash_size detect --flash_freq 40m ADDRESS FILEDIRECTORY (continues on next page)
```

(continued from previous page)

- Replace PORT with the port name
- Replace BAUD with baud rate
- Replace ADDRESS with the start address in flash. ESP-AT has strict requirements on the ADDRESS parameter. The address of factory parameter bin varies from firmware to firmware. Please refer to the table below:

Table 1: factory parameter bin download addresses

Platform	Firmware	Address
PLATFORM_ESP32C2	ESP32C2-2MB Bin	0x1B000
PLATFORM_ESP32C2	ESP32C2-4MB Bin	0x2B000

- Replace FILEDIRECTORY with the relative path of the factory parameter bin.

Below is the example command to flash the generated factory parameter bin to MY_MODULE:

```
python esp-idf/components/esptool_py/esptool/esptool.py -p /dev/ttyUSB0 -b 921600 -
↪-before default_reset --after hard_reset --chip auto write_flash --flash_mode_
↪dio --flash_size detect --flash_freq 40m 0x2B000 ./factory_param_MY_MODULE.bin
```

Directly Modify Factory Parameter Bin

Open the factory parameter bin with a binary tool, and directly modify the parameters in the corresponding position according to the parameters offset in factory_param_type.csv.

Download the new factory_param.bin into flash (see [Downloading Guide](#)).

5.6 How to Customize Partitions

This document describes how to customize the partitions in your ESP32-C2 by modifying the at_customize.csv table provided by ESP-AT. There are two partition tables: the primary partition and the secondary partition table.

The primary partition table partitions_at.csv is for system usage, based on which the partitions_at.bin file is generated. If the primary partition table goes wrong, the system will fail to startup. Therefore, it is not recommended to modify the partitions_at.csv.

ESP-AT provides a secondary partition table at_customize.csv that you can customize to store self-defined blocks of data. It is based on the primary partition table.

To modify the partition in your ESP32-C2, please follow the first three steps. The fourth section illustrates the three steps with an example.

- [Modify at_customize.csv](#)
- [Generate at_customize.bin](#)
- [Flash at_customize.bin into ESP32-C2 Device](#)
- [Example](#)

5.6.1 Modify at_customize.csv

Find the at_customize.csv for your module with reference to the following table.

Table 2: at_customize.csv paths

Platform	Module	Paths
ESP32-C2	ESP32C2-2MB (all ESP32C2 (ESP8684) series with 2 MB flash)	module_config/module_esp32c2-2mb/at_customize.csv
ESP32-C2	ESP32C2-4MB (all ESP32C2 (ESP8684) series with 4 MB flash)	module_config/module_esp32c2_default/at_customize.csv

Then, follow the rules below when modifying at_customize.csv.

- Do not change the Name and Type of the user partitions that have already been defined in it, while SubType, Offset, and Size can be changed.
- If you need to add a new user partition, please check if it has already been defined in the ESP-IDF (esp_partition.h) first.
 - If yes, you should keep the Type value the same as that of ESP-IDF.
 - If no, please set the Type to 0x40.
- A user partition's Name should not be longer than 16 bytes.
- The default size of the entire at_customize partition is defined in the partitions_at.csv table. Please do not exceed the range when adding new user partitions.

5.6.2 Generate at_customize.bin

After having modified the at_customize.csv, you can either recompile the ESP-AT project to generate the at_customize.bin file, or use the python script gen_esp32part.py.

If you use the script, execute the following command under the root directory of ESP-AT project and replace INPUT and OUTPUT:

```
python esp-idf/components/partition_table/gen_esp32part.py <INPUT> [OUTPUT]
```

- Replace INPUT with the path to at_customize.csv or the binary file to parse.
- Replace OUTPUT with the path to output converted binary or CSV file. Stdout will be used if omitted.

5.6.3 Flash at_customize.bin into ESP32-C2 Device

Download the at_customize.bin into flash. Please refer to [Flash AT Firmware into Your Device](#) for how to flash bin files into ESP32-C2 device and the following table for the download address for your module.

Table 3: at_customize.bin download address of modules

Platform	Module	Address	Size
ESP32-C2	ESP32C2-2MB (all ESP32C2 (ESP8684) series with 2 MB flash)	0x1A000	0x26000
ESP32-C2	ESP32C2-4MB (all ESP32C2 (ESP8684) series with 4 MB flash)	0x1E000	0x42000

There are cases where at_customize.bin must be downloaded to flash in order to use certain AT commands:

- *AT+SYSFLASH: Query/Set User Partitions in Flash*
- *AT+FS: Filesystem Operations*
- SSL server relevant commands
- BLE server relevant commands

5.6.4 Example

The section demonstrates how to add a 4 KB partition named test into the ESP8684-MINI-1 4MB module.

Firstly, find the at_customize.csv table for ESP8684-MINI-1 4MB and set the Name, Type, Subtype, Offset, and Size of the new partition:

Secondly, recompile the ESP-AT project, or execute the python script in the ESP-AT root directory to generate `at_customize.bin`.

```
python esp-idf/components/partition_table/gen_esp32part.py -q ./module_config/  
↳module_esp32c2_default/at_customize.csv at_customize.bin
```

Then, the `at_customize.bin` will be generated in the ESP-AT root directory.

Thirdly, download the `at_customize.bin` to flash.

Execute the following command under the root directory of ESP-AT project and replace `PORT` and `BAUD`.

```
python esp-idf/components/esptool_py/esptool/esptool.py -p PORT -b BAUD --before_  
↳default_reset --after hard_reset --chip auto write_flash --flash_mode dio --  
↳flash_size detect --flash_freq 40m 0x1E000 ./at_customize.bin
```

- Replace `PORT` with your port name.
- Replace `BAUD` with the baud rate.

5.7 How to Add Support for a Module

The ESP-AT project supports multiple modules, and provides configuration for them in the `factory_param_data.csv` table and the files in the `module_config` folder. See the table below for the supported platforms (chip series) and modules, as well as locations of the default configuration files.

Table 4: default configuration files

Platform	Module	Default
ESP32	<ul style="list-style-type: none"> • WROOM-32 • PICO-D4 • SOLO-1 • MINI-1 	<ul style="list-style-type: none"> • module_config/module_esp32_default/sdkconfig.defaults • module_config/module_esp32_default/sdkconfig_silence.defaults
ESP32	WROVER-32	<ul style="list-style-type: none"> • module_config/module_wrover-32/sdkconfig.defaults • module_config/module_wrover-32/sdkconfig_silence.defaults
ESP32	ESP32-D2WD	<ul style="list-style-type: none"> • module_config/module_esp32-d2wd/sdkconfig.defaults • module_config/module_esp32-d2wd/sdkconfig_silence.defaults
ESP32	ESP32_QCLOUD	<ul style="list-style-type: none"> • module_config/module_esp32_qcloud/sdkconfig.defaults • module_config/module_esp32_qcloud/sdkconfig_silence.defaults
ESP32-C2	ESP32C2-2MB (all ESP32C2 (ESP8684) series with 2 MB flash)	<ul style="list-style-type: none"> • module_config/module_esp32c2-2mb/sdkconfig.defaults • module_config/module_esp32c2-2mb/sdkconfig_silence.defaults
ESP32-C2	ESP32C2-4MB (all ESP32C2 (ESP8684) series with 4 MB flash)	<ul style="list-style-type: none"> • module_config/module_esp32c2_default/sdkconfig.defaults • module_config/module_esp32c2_default/sdkconfig_silence.defaults
ESP32-C3	MINI-1	<ul style="list-style-type: none"> • module_config/module_esp32c3_default/sdkconfig.defaults • module_config/module_esp32c3_default/sdkconfig_silence.defaults
ESP32-C3	ESP32C3_QCLOUD	<ul style="list-style-type: none"> • module_config/module_esp32c3_qcloud/sdkconfig.defaults • module_config/module_esp32c3_qcloud/sdkconfig_silence.defaults

Note:

- When the `silence` mode in `./build.py` `menuconfig` is 0, the default `sdconfig` corresponding to the module is `sdconfig.defaults`.
- When the `silence` mode in `./build.py` `menuconfig` is 1, the default `sdconfig` corresponding to the module is `sdconfig_silence.defaults`.

If you want to add support for an ESP32-C2 module in your ESP-AT project, you need to modify those configuration files. The “ESP32-C2 module” here means:

- Modules that the ESP-AT project has not supported yet, including those of supported platform and not supported platform. However, adding support for the latter requires extra huge work, thus not recommended and not explained in this document.
- Modules that the ESP-AT project supports, but you want to modify the default configuration.

The document uses an example to explain how to add support for an ESP32-C2 module in the ESP-AT project. The example module is ESP32-WROOM-32 that uses SDIO instead of the default UART interface.

5.7.1 Add Module to factory_param_data.csv

Open your local `factory_param_data.csv`, insert a new row at the end, set the parameters as needed. In the example, we set `platform` to `PLATFORM_ESP32`, `module_name` to `WROOM32-SDIO`, as well as other parameters as follows (see [factory_param_type.csv](#) for what each parameter represents):

- `platform`: `PLATFORM_ESP32`
- `module_name`: `WROOM32-SDIO`
- `description`:
- `magic_flag`: `0xfcfc`
- `version`: `3`
- `reserved1`: `0`
- `tx_max_power`: `78`
- `uart_port`: `1`
- `start_channel`: `1`
- `channel_num`: `13`
- `country_code`: `CN`
- `uart_baudrate`: `-1`
- `uart_tx_pin`: `-1`
- `uart_rx_pin`: `-1`
- `uart_cts_pin`: `-1`
- `uart_rts_pin`: `-1`
- `tx_control_pin`: `-1`
- `rx_control_pin`: `-1`

5.7.2 Modify esp_at_module_info Structure

Refer to [Modify esp_at_module_info Structure](#) for details.

5.7.3 Configure the Module

Firstly, enter `module_config` folder, and create a new folder to store all the configuration files for your module. Note that the folder name should be in lower case. Then, add the configuration files in the new folder: `IDF_VERSION`, `at_customize.csv`, `partitions_at.csv`, `sdkconfig.defaults`, and `sdkconfig_silence.defaults`.

In this example, we copy the `module_esp32_default` folder as well as the files within it and rename it as `module_wroom32-sdio`. The copied `IDF_VERSION`, `at_customize.csv`, and `partitions_at.csv` do not need any modification in our case. We only need to modify the `sdkconfig.defaults` and `sdkconfig_silence.defaults`:

- Modify the two files to use the partition table in the `module_wroom32-sdio` folder as follows:

```
CONFIG_PARTITION_TABLE_CUSTOM_FILENAME="module_config/module_wroom32-sdio/
↪partitions_at.csv"
CONFIG_PARTITION_TABLE_FILENAME="module_config/module_wroom32-sdio/partitions_
↪at.csv"
CONFIG_AT_CUSTOMIZED_PARTITION_TABLE_FILE="module_config/module_wroom32-sdio/
↪at_customize.csv"
```

- Modify the two files to use the SDIO configuration and remove the UART configuration as follows:
 - Remove the UART configuration

```
CONFIG_AT_BASE_ON_UART=n
```

- Add the SDIO configuration

```
CONFIG_AT_BASE_ON_SDIO=y
```

After finishing the above steps, you can recompile the ESP-AT project to generate the firmware for your module. In this example, we choose `PLATFORM_ESP32` and `WROOM32-SDIO` when configuring the project to generate the firmware for it.

5.8 SPI AT Guide

This document mainly introduces the implementation and use of SPI AT, mainly involving the following aspects:

- [Overview](#)
- [How to Use SPI AT?](#)
- [SPI AT Throughput](#)

5.8.1 Overview

SPI AT is based on ESP-AT project and uses SPI protocol for data communication. When SPI AT is used, MCU works as SPI master and ESP32-C2 AT device works as SPI slave. Both sides of communication exchange data based on AT command through SPI protocol.

Why SPI AT?

ESP-AT project uses UART protocol for data communication by default, but UART protocol is not applicable in some application scenarios that need high-speed data transmission. In this case, the SPI protocol which supports a higher transmission rate is a better choice.

How to enable SPI AT?

You can configure and enable SPI AT through the following steps:

1. `./build.py menuconfig->Component config->AT->communicate method for AT command->AT through HSPI to enable SPI AT.`
2. `./build.py menuconfig->Component config->AT->communicate method for AT command->AT SPI Data Transmission Mode to choose the SPI data transmission mode.`
3. `./build.py menuconfig->Component config->AT->communicate method for AT command->AT SPI GPIO settings to change the default pin assignments for SPI AT.`
4. `./build.py menuconfig->Component config->AT->communicate method for AT command->AT SPI driver settings to choose the SPI slave mode, and config the buffer size for data transmission.`
5. Recompile the `esp-at` project(see [Compile ESP-AT Project](#)), download AT bin into flash.

The Default Pin Assignment

The following pin assignments are used by default:

Table 5: The Default Pins for SPI AT

Signal	GPIO Number
SCLK	6
MISO	2
MOSI	7
CS	10
HANDSHAKE	3
GND	GND
QUADWP (qio/qout) ¹	8
QUADHD (qio/qout) ¹	9

Note 1: QUADWP and QUADHD signals are only used for 4-bit (qio/qout) transactions.

You can change the default pin assignments by `./build.py menuconfig > Component config > AT > communicate method for AT command > AT through HSPI > AT SPI GPIO settings` and compile the project (see [Compile ESP-AT Project](#)).

5.8.2 How to Use SPI AT?

When SPI AT is used, ESP32-C2 works in SPI half-duplex mode as a slave.

Handshake Pin

Since SPI is a master-slave model, all transmission is initiated by the master, and the slave cannot actively transmit data. However, when AT command is used for data interaction, ESP32-C2 (slave) is required to actively report some information. Therefore, a handshake line is added between SPI master and slave to achieve the purpose.

When the slave needs to transfer data, it pulls up the handshake pin, generating a rising edge GPIO interrupt on the master side. Then, the master initiates communication with the slave. After the data is transferred, the slave pulls down the handshake pin to end this communication.

The specific methods of using the handshake line are as follows:

- When master sends AT commands to slave via SPI, the workflow with an extra handshake line is as follows:
 1. The master sends a request for data transmission to the slave, and then waits for the signal sent by the slave to the handshake line to allow data transmission.
 2. After the master detects the permission signal sent by the slave on the handshake line, it starts to send data.
 3. After sending the data, the master notifies slave that the data transmission is finished.
- When slave sends AT responses to master via SPI, the workflow with an extra handshake line is as follows:
 1. The slave sends a signal through the handshake line to inform the master to start receiving data.
 2. The master receives data and notifies slave that the data transmission is finished after receiving all data.

Communication Formats

The communication format used by SPI AT is `CMD+ADDR+DUMMY+DATA` (Read or Write). When using SPI AT, some communication messages used by SPI master are described as follows:

- The message used by the master to send data to slave:

Table 6: Master write data to slave

CMD (1 byte)	ADDR (1 byte)	DUMMY (1 byte)	DATA (Up to 4092 bytes)
0x3	0x0	0x0	data_buffer

- The message used by the master to inform the slave all data has been sent:

Table 7: Master write data done

CMD (1 byte)	ADDR (1 byte)	DUMMY (1 byte)	DATA
0x7	0x0	0x0	null

- The message used by the master to receive data from the slave:

Table 8: Master read data from slave

CMD (1 byte)	ADDR (1 byte)	DUMMY (1 byte)	DATA (Up to 4092 bytes)
0x4	0x0	0x0	data_buffer

- The message used by the master to inform the slave all data has been received:

Table 9: Master read data done

CMD (1 byte)	ADDR (1 byte)	DUMMY (1 byte)	DATA
0x8	0x0	0x0	null

- The message used by the master to send a request to send data:

Table 10: Master request to send data

CMD (1 byte)	ADDR (1 byte)	DUMMY (1 byte)	DATA (4 bytes)
0x1	0x0	0x0	data_info

The 4-byte length `data_info` contains the information about the packet to be sent. The specific format is as follows:

- 0~15 bits: the length of the data that the master want to send to the slave.
 - 16~23 bits: the sequence number of the packet sent by the master to the slave.
 - 24~31 bits: the magic num, and default value is 0xFE.
- After receiving the signal from the handshake line, the master can send the message to query the read or write status of the slave:

Table 11: Master query the read/write status of the slave

CMD (1 byte)	ADDR (1 byte)	DUMMY (1 byte)	DATA (4 bytes)
0x2	0x4	0x0	slave_status

After sending the query request, the slave's status returned will be stored in the 4-byte length `slave_status`, the specific format is as follows:

- 0~15 bits: the length of the data the slave wants to send to the master. This field is valid only when the slave is readable.
- 16~23 bits: the sequence number of the packet to be sent. The maximum sequence number is 0xFF, and if the number is reached, the sequence number is incremented by 1 from 0.
- 24~31 bits: the slave status (readable/writable). 0x1 means readable, and 0x2 means writable.

SPI AT Workflow

The workflows mainly includes two aspects:

- When master sends AT commands to slave, the workflow is as follows:

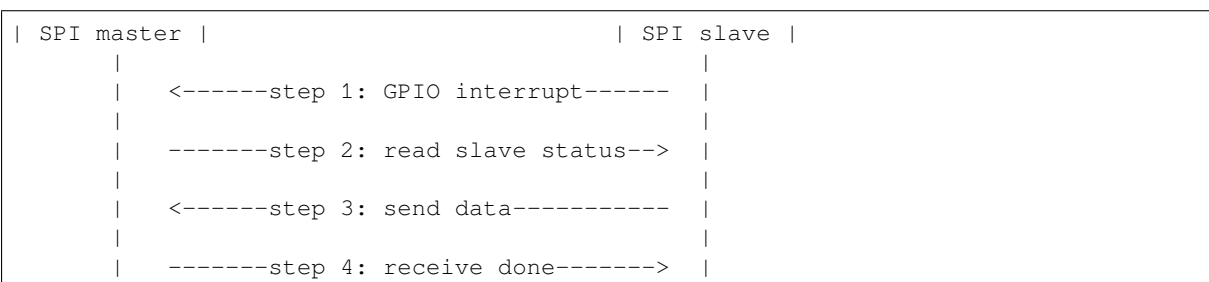

SPI master	SPI slave
-----step 1: request to send---->	
<-----step 2: GPIO interrupt-----	
-----step 3: read slave status-->	
-----step 4: send data----->	
-----step 5: send done----->	

The specific description of each step is as follows:

step 1. The master sends a request for data transmission to the slave. step 2. The slave receives the request from the master. If the master is allowed to send data, the slave sets the status register, and then triggers the GPIO interrupt on the master through the handshake line. step 3. After receiving the interrupt, master will query the status register

of slave. If the query result shows that the slave is in the writable state, the master starts to send data. step 4. The master send data to the slave. step 5. After sending the data, the master notifies slave that the data transmission is finished.

- When master receives AT responses from slave, the workflow is as follows:

The specific description of each step is as follows:

step 1. The slave sets the status register, and then triggers the GPIO interrupt on the master through the handshake line. step 2. After receiving the interrupt, master will query the status register of slave. If the query result shows that the slave is in the readable state, the master starts to receive data. step 3. The master receives the data send by the slave. step 4. After receiving all data, the master notifies the slave that the data transmission is finished.

Note 1. To facilitate understanding, the [at_spi_master/spi/esp32_c_series/README.md](#) provides all the interaction workflow and logic analyzer data involved in the communication by taking sending an AT command as an example.

Sample Code of SPI Master for SPI AT

SPI AT is used as the SPI slave. For a code example of communication between the SPI master and the SPI slave, please refer to [at_spi_master/spi/esp32_c_series](#).

Note 1. Before developing with MCU, it is highly recommended to run this example using ESP32-C3 or ESP32 emulated MCU as SPI master to make it easier to debug problems.

5.8.3 SPI AT Throughput

Introduction of the Test

- An ESP32 or ESP32-C3 development board is been used as SPI master. The application runs in the board can be found under the directory [at_spi_master/spi/esp32_c_series](#) of the [ESP-AT](#) project. Some related configurations are described below:
 1. Hardware configuration: The frequency of CPU is 240 MHz, flash SPI mode is in QIO mode with 40 MHz.
 2. Software configuration: The [ESP-IDF](#) version is v4.3. The size of streambuffer is 8192 bytes.
- An ESP32-C2-DevKitC development board is been used as SPI slave. Please refer to [Compile ESP-AT Project](#) to build your own ESP-AT project and flash the generated binary files into the board. The board works in the TCP passthrough mode, and some related configurations are described below:
 1. Hardware configuration: The frequency of CPU is 160 MHz.
 2. Software configuration: The size of streambuffer is 8192 bytes, the sdkconfig is [sdkconfig.defaults.esp32c3](#).

Reference Results

The table below shows the throughput results we got in a shield box.

Table 12: SPI AT Wi-Fi TCP Throughput

Clock	SPI mode	master->slave	slave->master
10 M	Standard	0.95 MByte/s	1.00 MByte/s
10 M	Dual	1.37 MByte/s	1.29 MByte/s
10 M	Quad	1.43 MByte/s	1.31 MByte/s
20 M	Standard	1.41 MByte/s	1.30 MByte/s
20 M	Dual	1.39 MByte/s	1.30 MByte/s
20 M	Quad	1.39 MByte/s	1.30 MByte/s
40 M	Standard	1.37 MByte/s	1.30 MByte/s
40 M	Dual	1.40 MByte/s	1.31 MByte/s
40 M	Quad	1.48 MByte/s	1.31 MByte/s

Note 1: When SPI clock frequency is high, due to the limitation of upper network components, the communication rate of Dual or Quad mode is not significantly improved compared with Standard mode.

Note 2: For more information about SPI communication, please refer to the [Technical Reference Manuals](#).

5.9 How to Implement OTA Upgrade

This document introduces how to implement OTA upgrade on ESP32-C2 series of modules. Currently, ESP-AT provides the following three OTA commands targeting at different scenarios. You could choose one command according to your needs.

1. [AT+USEROTA](#)
2. [AT+CIUPDATE](#)
3. [AT+WEBSERVER](#)

The structure of this document is as follows:

- [Comparison Among OTA Commands and Their Application Scenarios](#)
- [Perform OTA Upgrade with ESP-AT OTA Commands](#)

5.9.1 Comparison Among OTA Commands and Their Application Scenarios

AT+USEROTA

This command implements OTA upgrade through a URL. You can upgrade to the firmware placed on the HTTP server. Currently, the command only supports the upgrade of app partitions. For more information on this command, please refer to [AT+USEROTA](#) for more details.

Since this command is a user-defined command, you can modify the implementation of this command by modifying the [at/src/at_user_cmd.c](#) source code.

The application scenarios of this command are as follows:

1. **You have your own HTTP server.**
2. **You need to specify the URL.**

Important:

- If the firmware you upgrade is not officially released by Espressif, you may no longer be able to use AT+CIUPDATE command to upgrade after the upgrade is complete, unless you create your own device according to [OTA Upgrade with AT+CIUPDATE](#).
-

AT+CIUPDATE

This command uses iot.espressif.cn as the default HTTP server. It can upgrade both the app partition and the user-defined partitions that are defined in the `at_customize.csv`. If you are using the version released by Espressif, it will only upgrade to the version released by Espressif. For more information on this command, please refer to [AT+CIUPDATE](#) for more details.

To upgrade the customized bin file with this command, please select one of the following ways.

1. **replace iot.espressif.cn with the your own HTTP server and implement the interactive process.** For how to implement your own AT+CIUPDATE command, please refer to [at/src/at_ota_cmd.c](#).
2. **create a devices on iot.espressif.cn and upload customized AT firmware on it.** (The premise is that the firmware running in the module already corresponds to the device you created on the Espressif server.) For more information, please refer to [OTA Upgrade with AT+CIUPDATE](#).

The application scenarios of this command are as follows:

1. **You only use the firmware released by Espressif, and only want to upgrade to the firmware released by Espressif.**
2. **You want to upgrade the customized bin file, but do not have an HTTP server.**
3. **You have your own HTTP server. In addition to the app partition, you also want to upgrade the user-defined partitions in `at_customize.csv`.**

AT+WEBSERVER

This command upgrades AT firmware with a browser or WeChat applet. Currently, this command only supports the upgrade of app partitions. Before starting the upgrade, please enable the web server command and copy the AT firmware to the computer or mobile phone in advance. For more information, you can refer to [AT+WEBSERVER](#) and [Web Server AT Example](#).

To implement your own HTML page, please refer to the example of [fs_image/index.html](#). To implement your own AT+WEBSERVER command, please refer to the example of [at/src/at_web_server_cmd.c](#).

The application scenarios of this command are as follows:

1. **You need a more convenient and faster OTA upgrade that does not rely on network status.**

Important:

- If the firmware you upgrade is not officially released by Espressif, you may no longer be able to use AT+CIUPDATE command to upgrade after the upgrade is complete, unless you create your own device according to [OTA Upgrade with AT+CIUPDATE](#).
-

5.9.2 Perform OTA Upgrade with ESP-AT OTA Commands

OTA Upgrade with AT+USEROTA

Please refer to [AT+USEROTA](#) for more details.

OTA Upgrade with AT+CIUPDATE

To upgrade the customized bin file with [AT+CIUPDATE](#) command, the first thing to do is to upload the bin file to the iot.espressif.cn and obtain the **token** value. The following steps describe how to create a device on iot.espressif.cn and upload the bin file to it.

1. Open the website <http://iot.espressif.cn> or <https://iot.espressif.cn>.
2. Click “Join” in the upper right corner of the webpage, and enter your name, email address, and password.

Fig. 3: Open iot.espressif.cn website

IoT-Espressif [Start](#) [Join](#) [Login](#)

Join

Name

Email

Password

Fig. 4: Join iot.espressif.cn website

Note:

- The Join function is currently not open to new users. If you want to use it, please contact [Espressif](#).

3. Click on “Device” in the upper left corner of the webpage, and click on “Create” to create a device.

Fig. 5: Click on “Device”

Fig. 6: Click on “Create”

4. A key is generated when the device is successfully created, as the figure below shows.
5. Use the key to compile your own OTA bin file. The process of configuring the AT OTA token key is as follows:

Note:

- If using SSL OTA, the option “The SSL token for AT OTA” also needs to be configured.

Fig. 7: A key has been generated

Fig. 8: Configuring the AT OTA token key - Step 1

Fig. 9: Configuring the AT OTA token key - Step 2 and 3

6. Click on “Product” to enter the webpage, as shown below. Click on the device created. Enter version and corename under “ROM Deploy”. Rename the bin file in Step 5 as “ota.bin” and save the configuration.

The screenshot shows the Espressif IoT-Debugger interface. The top navigation bar includes 'Device', 'Product', 'Start', and a user profile 'weiyuanjia'. The main heading is 'Product'. Below it, there's a search bar and filters for 'product' and 'status'. A product card for 'esp_iot_test' (Id: 3867, Serial: 6b4dd7a9) is shown with a status of 'developing' and a progress bar at 0%. Below the product card, there are two sections: 'Datastreams' with a '+ Create' button, and 'ROM Deploy' which contains fields for 'version' (v1.0), a dropdown for 'beta', and 'corename' (iot_test). At the bottom of the ROM Deploy section, there's a text prompt 'upload rom files, support max 10 files +' and a file upload area showing 'ota.bin'.

Fig. 10: Enter version and corename

Note:

- If you want to upgrade the user-defined partition defined in the `at_customize.csv`, just replace `ota.bin` with the bin of the user-defined partition.
- For the field `corename`, the purpose of this field is only to help you distinguish bin files.

7. Click on the `ota.bin` to save it as the current version.
 8. Run the command `AT+USEROTA` on the ESP32-C2. If the network is connected, OTA upgrade will begin.

Important:

Fig. 11: Save the current version of ota.bin

- When setting the name of bin files uploaded to the `iot.espressif.cn`, please follow the rules below:
 - If you upgrade app partitions, set the bin file name to `ota.bin`.
 - If you upgrade a user-defined partition, set the bin file name as the Name field in the `at_customize.csv`. For example, if you upgrade `factory_Param` partition, please set it to `factory_param.bin`.
- ESP-AT stores the new firmware in a spare OTA partition. In this way, even if OTA fails due to unexpected reasons, the original ESP-AT firmware can still run. But for user-defined partitions, because ESP-AT has no backup measures, please upgrade it carefully.
- **If you intend to upgrade only customized bin file at the beginning, please set the OTA token to your own token value when the initial version is released.**

OTA Upgrade with AT+WEBSERVER

Please refer to [AT+WEBSERVER](#) and [Web Server AT Example](#) for more details.

5.10 How to Update the ESP-IDF Version

ESP-AT firmware is based on the Espressif IoT Development Framework (ESP-IDF), and each version of ESP-AT firmware corresponds to a specific ESP-IDF version. It is strongly recommended to use the default ESP-IDF version of the ESP-AT project, and **NOT** recommended to update it, because the inconsistency between the underlying ESP-IDF versions of `libesp32c2_at_core.a` and the ESP-AT project may cause incorrect operation of the firmware.

However, in some special cases, a minor updated ESP-IDF version may be also able to work with the ESP-AT project. In case you should update it, this document can be a reference.

The ESP-IDF version that a specific ESP-AT firmware corresponds to is recorded in the `IDF_VERSION` files, which are distributed in different module folders under the `module_config` folder. The file describes the

branch, commit ID, and repository URL of the ESP-IDF that a module firmware is based on. For example, the `IDF_VERSION` of the undefined module of `PLATFORM_ESP32C2` platform is located at [module_config/module_esp32c2_default/IDF_VERSION](#).

If you want to update the ESP-IDF version for your ESP-AT firmware, please follow the steps:

- Find the `IDF_VERSION` file for your module.
- Update the branch, commit ID, repository as needed.
- Delete the original `esp-idf` under the `esp-at` root directory, so that the ESP-IDF of the version specified in `IDF_VERSION` will be cloned first in the next compilation.
- Recompile the ESP-AT project.

Note that when the ESP-AT version and the ESP-IDF version do not match, the following error will be reported when compiling:

Please wait **for** the update to complete, which will take some time

5.11 ESP-AT Firmware Differences

This document compares the differences among AT firmwares of a certain ESP32-C2 series in terms of the supported commands set, hardware, and supported modules.

5.11.1 ESP32-C2 Series

This section describes the differences among AT firmwares of ESP32-C2 series, including

- ESP32C2-2MB_AT_Bin (referred to as **ESP32C2-2MB Bin** in this section);
- ESP32C2-4MB_AT_Bin (referred to as **ESP32C2-4MB Bin** in this section);

Supported Command Set

The table lists which command set is supported by default in the official AT firmware applicable to ESP32-C2 series of modules (marked with ) , which is not supported by default but can be supported after configuration of the ESP-AT project (marked with ) , and which is not supported at all (marked with ) . Note that the command set that is not shown in this table is not supported either. Applicable firmware that has not been *officially released* requires compilation by yourself. Those self-compiled firmware cannot be upgraded OTA from Espressif official server.

Command Set	ESP32C2-2MB Bin	ESP32C2-4MB Bin
base	✓	✓
user	✓	✓
wifi	✓	✓
net	✓	✓
MDNS	✓	✓
WPS	✓	✓
smartconfig	✓	✓
ping	✓	✓
MQTT	✓	✓
http	✓	✓
FS	✓	✓
driver	✓	✓
WPA2	✓	✓
WEB	✓	✓
OTA	✓	✓
blufi	✓	✓

Hardware Differences

Hardware	ESP32C2-2MB	ESP32C2-4MB
Flash	2 MB	4 MB
PSRAM	✗	✗
UART Pins ¹	TX: 7 RX: 6 CTS: 19 RTS: 20	TX: 7 RX: 6 CTS: 5 RTS: 4

Supported Modules

The table lists the ESP32-C2 modules or chips that each AT firmware supports.

Module/Chip	ESP32C2-2MB Bin	ESP32C2-4MB Bin
ESP8684 MINI series	✓	✓
ESP8684 WROOM series	✓	✓

5.12 How to Download the Latest Temporary Version of AT Firmware from GitHub

As ESP-AT enables CI (Continuous Integration) on GitHub, temporary versions of ESP-AT firmware is generated every time when the code is pushed to GitHub.

¹ UART pins can be customized. See [How to Set AT Port Pins](#) for details.

Attention: The temporary version of AT firmware is only for testing, and Espressif is not responsible for it. You need to test functions what you need by yourself.

Please save the firmware and download link, for possible issue location in your follow-ups.

The following steps guide you on how to download the latest temporary version of AT firmware from GitHub.

1. Sign in your GitHub account
Before you start, **please sign in your GitHub account**, as you need login permission to download firmware.
2. Open the website <https://github.com/espressif/esp-at>

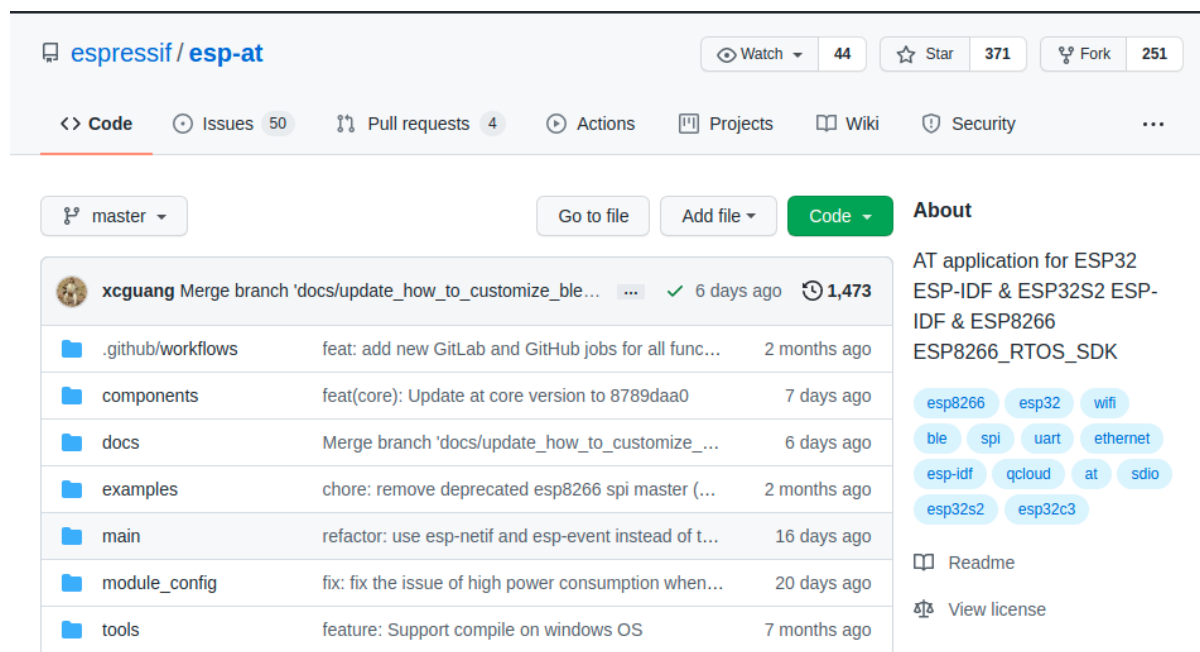

Fig. 12: ESP-AT GitHub Home Page

3. Click “Actions” to enter the “Actions” page
4. Click the branch and choose the specified branch
Default branch is master. If you want to download the temporary firmware of the specified branch, click “Branch” to enter the workflow page of the specified branch.
5. Click the latest workflow and enter the latest workflow page
6. Scroll the page to the end, select the corresponding module on the `Artifacts` page
7. Click to download the temporary version of AT firmware for modules

Note: If you do not find the firmware of the corresponding module on the `Artifacts` page, you can refer to [ESP-AT Firmware Differences](#) to select a similar firmware to download.

5.13 How to Generate PKI Files

ESP-AT provides python script `AtPKI.py` to convert SSL server certificates, SSL client certificates, MQTT certificates, and WPA2 certificates files (including CA, cert, and private key files) into bin files.

- [Certificate Bin Files Format](#)
- [Generate Certificate Bin Files](#)

Fig. 13: Click Actions

Fig. 14: Actions Page

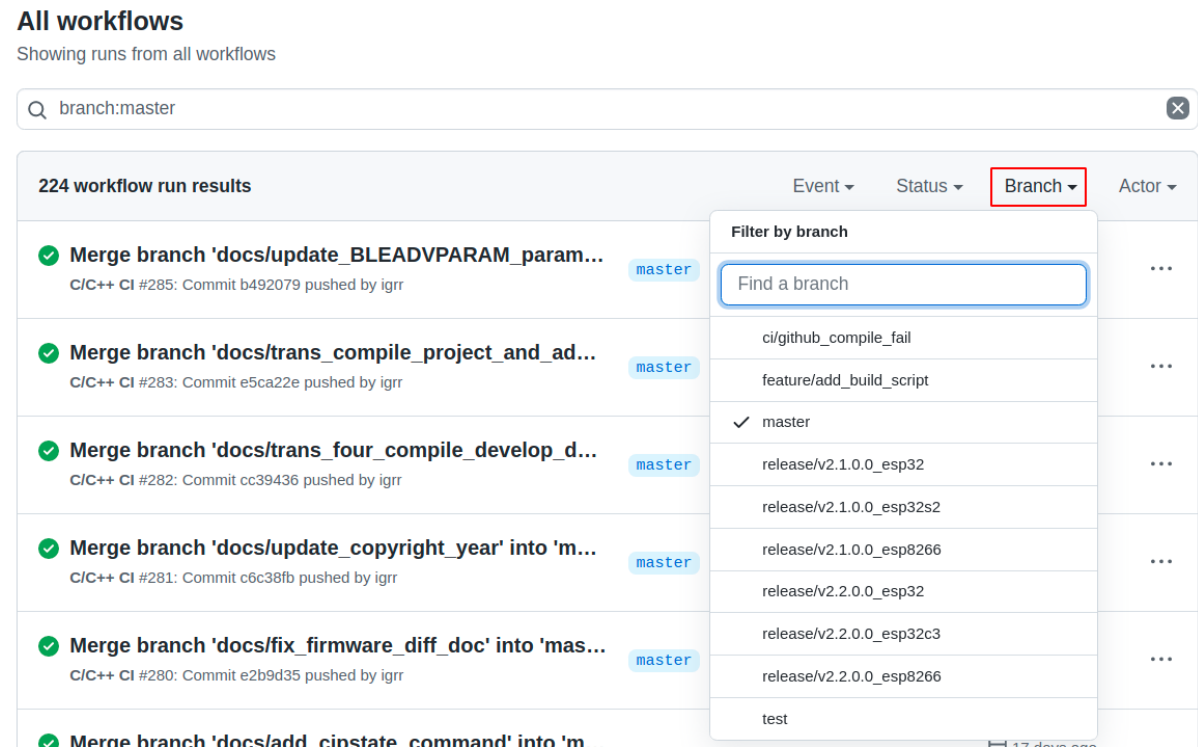

Fig. 15: Click the Branch

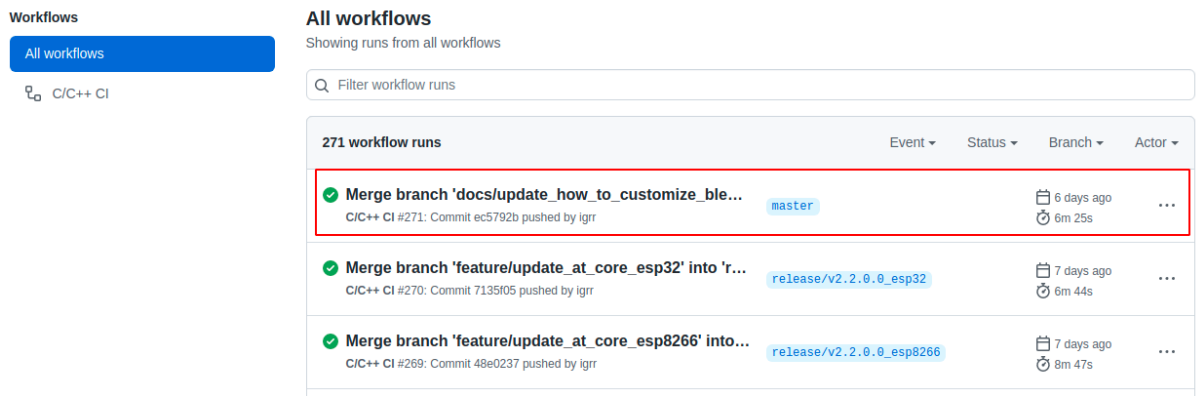

Fig. 16: Click the Latest Workflow

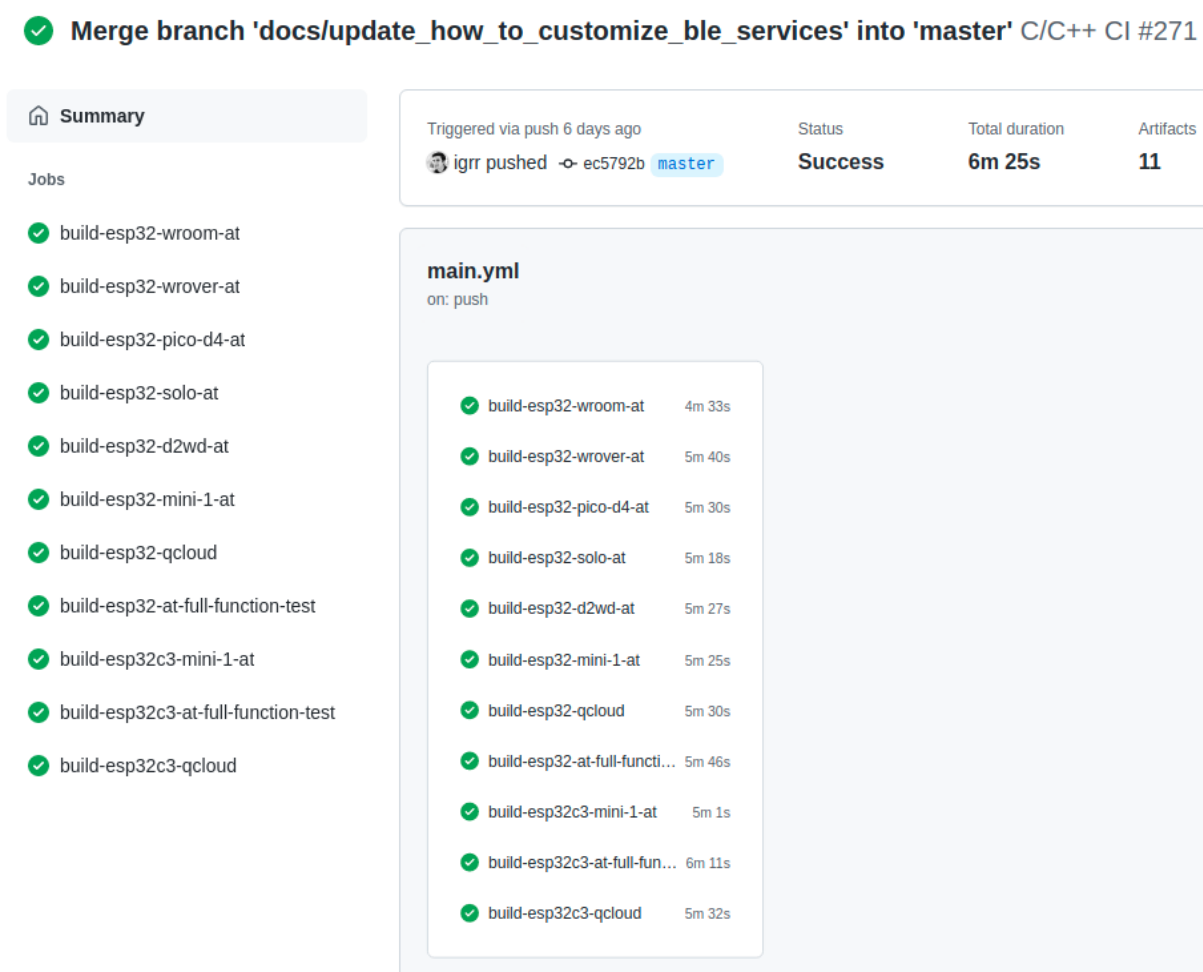

Fig. 17: Latest Workflow Page

Artifacts		
Produced during runtime		
Name		Size
 esp32-at-full-function-test		35.8 MB
 esp32-d2wd-at		26.2 MB
 esp32-mini-1-at		28.3 MB

 esp32-qcloud		29.2 MB
 esp32-solo-1-at		28.3 MB
 esp32-wroom-at		28.3 MB
 esp32-wrover-at		30.2 MB
 esp32c3-at-full-function-test		29.7 MB
 esp32c3-mini-1-at		27.5 MB
 esp32c3-qcloud		28.5 MB

Fig. 18: Artifacts Page

- [Download or Update Certificate Bin Files](#)

5.13.1 Certificate Bin Files Format

In addition to converting the certificate file into a bin file, the script `AtPKI.py` adds some additional information to the bin file.

When converting a single certificate file, the script will add 12 bytes in little-endian format to the header and 4 bytes aligned at the end.

Field	Description
magic code (2 bytes)	0xF1 0xF1
list size (2 bytes)	the number of certificate files
length (4 bytes)	remaining file size = total file size - magic code size - list size - length size
type (1 bytes)	ca: 0x01 certificate: 0x02 key: 0x03
ID (1 bytes)	used to match certificate files
content len (2 bytes)	the size of the certificate file converted to the bin file

Taking the `client_cert.bin` generated in the [Generate Certificate Bin Files](#) section as an example, the 12 bytes in little-endian format at the beginning of the file are:

Field	Description
magic code (2 bytes)	0xF1 0xF1
list size (2 bytes)	0x02 0x00
length (4 bytes)	0x20 0x09 0x00 0x00
type (1 bytes)	0x02
ID (1 bytes)	0x00
content len (2 bytes)	0x8C 0x04

When converting multiple certificate files, the script `AtPKI.py` inserts 4 bytes at the beginning of every file except the first one. The 4 bytes in little-endian format at the beginning of the file are:

Field	Description
type (1 bytes)	ca: 0x01 certificate: 0x02 key: 0x03
ID (1 bytes)	used to match certificate files
content len (2 bytes)	the size of the certificate file converted to the bin file

Taking the `client_cert.bin` generated in the [Generate Certificate Bin Files](#) section as an example, the 4 bytes in little-endian format at the beginning of the file are:

Field	Description
type (1 bytes)	certificate: 0x02
ID (1 bytes)	0x01
content len (2 bytes)	0x8C 0x04

5.13.2 Generate Certificate Bin Files

Select one of the following ways to generate certificate bin files.

- [Script Generation](#)
- [Generation During Compilation](#)

Script Generation

The path of `AtPKI.py` is [tools/AtPKI.py](#). You can get help information of the script through the `-h` option. You can also generate bin files directly through the following commands.

```
python <SCRIPT_PATH> generate_bin [-b OUTPUT_BIN_NAME] <PKI_LIST> <source_file>
```

- `SCRIPT_PATH`: the path the script. If you're in "tools" folder of ESP-AT project, `SCRIPT_PATH` is `AtPKI.py`.
- `OUTPUT_BIN_NAME`: the target file which you want to save the generated bin (absolute address or relative address of the target file); if `-b OUTPUT_BIN_NAME` is omitted, it will generate `PKI.bin` in the current directory.
- `PKI_LIST`: must be equal to one of `ca`, `cert`, `key`.
- `source_file`: the certificate source file which you want to convert (absolute address or relative address of the source file).

Taking the SSL client certificate files of ESP-AT as an example, you can execute the following command to generate `client_cert.bin` in the tools directory:

```
python AtPKI.py generate_bin -b ./client_cert.bin cert ../components/customized_
↪ partitions/raw_data/client_cert/client_cert_00.crt cert ../components/customized_
↪ partitions/raw_data/client_cert/client_cert_01.crt
```

Generation During Compilation

The storage path of certificate files in ESP-AT is [components/customized_partitions/raw_data](#).

Taking the SSL client certificate files of ESP-AT as an example. If you want to generate your own SSL client certificates files, you must replace the CA certificate in the `client_ca` directory with your own CA certificate, the cert certificate in the `client_cert` directory with your own cert certificate, and the private key in the `client_key` directory with your own private key.

If you have multiple sets of certificate files, please place them in the corresponding directory according to your certificate chain. It is recommended that you end the file name with a number to ensure the parsing order of the certificate files.

After replacement, You can refer to [Compile ESP-AT Project](#) to compile the ESP-AT project.

5.13.3 Download or Update Certificate Bin Files

The script `AtPKI.py` is only responsible for converting the certificate files to bin files. You can download bin files to the corresponding flash partition in one of the following ways:

Download with Tools

- Windows
Please download [Flash Download Tools for Windows](#).
For more details about the Tools, please see `readme.pdf` or the `doc` folder in the zip folder.

- Linux or macOS

Please use [esptool.py](#).

You can execute the following command in the root directory of ESP-AT to download bin files.

```
esptool.py --chip auto --port PORTNAME --baud 921600 --before default_reset --
↳after hard_reset write_flash -z --flash_mode dio --flash_freq 40m --flash_
↳size 4MB ADDRESS FILEDIRECTORY
```

Replace PORTNAME with your port name. Replace ADDRESS with the the download address. Replace FILEDIRECTORY with the file directory of the bin.

Update with Commands

- AT+SYSFLASH**

Taking ESP32-C2 module as an example, you can execute the following command to upgrade the client_cert partition. Please refer to **AT+SYSFLASH** for more details.

- Query user partitions in flash

Command:

```
AT+SYSFLASH?
```

Response:

```
+SYSFLASH:"server_cert",64,1,0x1f000,0x2000
+SYSFLASH:"server_key",64,2,0x21000,0x2000
+SYSFLASH:"server_ca",64,3,0x23000,0x2000
+SYSFLASH:"client_cert",64,4,0x25000,0x2000
+SYSFLASH:"client_key",64,5,0x27000,0x2000
+SYSFLASH:"client_ca",64,6,0x29000,0x2000
+SYSFLASH:"factory_param",64,7,0x2b000,0x1000
+SYSFLASH:"wpa2_cert",64,8,0x2c000,0x2000
+SYSFLASH:"wpa2_key",64,9,0x2e000,0x2000
+SYSFLASH:"wpa2_ca",64,10,0x30000,0x2000
+SYSFLASH:"mqtt_cert",64,11,0x32000,0x2000
+SYSFLASH:"mqtt_key",64,12,0x34000,0x2000
+SYSFLASH:"mqtt_ca",64,13,0x36000,0x2000
+SYSFLASH:"ble_data",64,14,0x38000,0x6000
+SYSFLASH:"fatfs",1,129,0x47000,0x19000

OK
```

- Erase client_cert sector

Command:

```
AT+SYSFLASH=0,"client_cert"
```

Response:

```
OK
```

- Update client_cert sector

Command:

```
AT+SYSFLASH=1,"client_cert",0,2344
```

Response:

```
>
```

If the operator is write, wrap return > after the write command, then you can send the data that you want to write. The length should be parameter <length>. When the write operation is completed, the system will prompt the following information.

OK

- [*AT+CIUPDATE*](#)

For example, you can execute the following command to upgrade the `client_ca` partition. Please refer to [*AT+CIUPDATE*](#) for more details.

Important: If you want to update the `client_ca` partition in this way, you must implement your own OTA device, please refer to [*How to Implement OTA Upgrade*](#).

AT+CIUPDATE=1, "v2.2.0.0", "client_ca"

Note: You must ensure that the download address is correct, otherwise the ESP-AT firmware may not work. The simplest way to view the download address is to execute the command **AT+SYSFLASH?**.

5.14 AT API Reference

5.14.1 Header File

- [components/at/include/esp_at_core.h](#)

5.14.2 Functions

void **esp_at_module_init** (uint32_t netconn_max, const uint8_t *custom_version)

This function should be called only once, before any other AT functions are called.

Parameters

- **netconn_max** –the maximum number of the link in the at module
- **custom_version** –version information by custom

esp_at_para_parse_result_type **esp_at_get_para_as_digit** (int32_t para_index, int32_t *value)

Parse digit parameter from command string.

Parameters

- **para_index** –the index of parameter
- **value** –the value parsed

Returns

- ESP_AT_PARA_PARSE_RESULT_OK : succeed
- ESP_AT_PARA_PARSE_RESULT_FAIL : fail
- ESP_AT_PARA_PARSE_RESULT_OMITTED : this parameter is OMITTED

esp_at_para_parse_result_type **esp_at_get_para_as_float** (int32_t para_index, float *value)

Parse float parameter from command string.

Parameters

- **para_index** –the index of parameter
- **value** –the value parsed

Returns

- ESP_AT_PARA_PARSE_RESULT_OK : succeed
- ESP_AT_PARA_PARSE_RESULT_FAIL : fail
- ESP_AT_PARA_PARSE_RESULT_OMITTED : this parameter is OMITTED

esp_at_para_parse_result_type **esp_at_get_para_as_str** (int32_t para_index, uint8_t **result)

Parse string parameter from command string.

Parameters

- **para_index** –the index of parameter
- **result** –the pointer that point to the result.

Returns

- ESP_AT_PARA_PARSE_RESULT_OK : succeed
- ESP_AT_PARA_PARSE_RESULT_FAIL : fail
- ESP_AT_PARA_PARSE_RESULT_OMITTED : this parameter is OMITTED

void **esp_at_port_recv_data_notify_from_isr** (int32_t len)

Calling the esp_at_port_recv_data_notify_from_isr to notify at module that at port received data. When received this notice, at task will get data by calling get_data_length and read_data in esp_at_device_ops. This function MUST be used in isr.

Parameters **len** –data length

bool **esp_at_port_recv_data_notify** (int32_t len, uint32_t msec)

Calling the esp_at_port_recv_data_notify to notify at module that at port received data. When received this notice, at task will get data by calling get_data_length and read_data in esp_at_device_ops. This function MUST NOT be used in isr.

Parameters

- **len** –data length
- **msec** –timeout time, The unit is millisecond. It waits forever, if msec is port-MAX_DELAY.

Returns

- true : succeed
- false : fail

void **esp_at_transmit_terminal_from_isr** (void)

terminal transparent transmit mode, This function MUST be used in isr.

void **esp_at_transmit_terminal** (void)

terminal transparent transmit mode, This function MUST NOT be used in isr.

bool **esp_at_custom_cmd_array_regist** (const *esp_at_cmd_struct* *custom_at_cmd_array, uint32_t cmd_num)

regist at command set, which defined by custom,

Parameters

- **custom_at_cmd_array** –at command set
- **cmd_num** –command number

void **esp_at_device_ops_regist** (*esp_at_device_ops_struct* *ops)

regist device operate functions set,

Parameters **ops** –device operate functions set

bool **esp_at_custom_net_ops_regist** (int32_t link_id, *esp_at_custom_net_ops_struct* *ops)

bool **esp_at_custom_ble_ops_regist** (int32_t conn_index, *esp_at_custom_ble_ops_struct* *ops)

void **esp_at_custom_ops_regist** (*esp_at_custom_ops_struct* *ops)

regist custom operate functions set interacting with AT,

Parameters **ops** –custom operate functions set

uint32_t **esp_at_get_version** (void)

get at module version number,

Returns at version bit31~bit24: at main version bit23~bit16: at sub version bit15~bit8 : at test version bit7~bit0 : at custom version

void **esp_at_response_result** (uint8_t result_code)

response AT process result,

Parameters **result_code** –see esp_at_result_code_string_index

`int32_t esp_at_port_write_data (uint8_t *data, int32_t len)`

write data into device,

Parameters

- **data** –data buffer to be written
- **len** –data length

Returns

- ≥ 0 : the real length of the data written
- others : fail.

`int32_t esp_at_port_active_write_data (uint8_t *data, int32_t len)`

call `pre_active_write_data_callback()` first and then write data into device,

Parameters

- **data** –data buffer to be written
- **len** –data length

Returns

- ≥ 0 : the real length of the data written
- others : fail.

`int32_t esp_at_port_read_data (uint8_t *data, int32_t len)`

read data from device,

Parameters

- **data** –data buffer
- **len** –data length

Returns

- ≥ 0 : the real length of the data read from device
- others : fail

`bool esp_at_port_wait_write_complete (int32_t timeout_msec)`

wait for transmitting data completely to peer device,

Parameters **timeout_msec** –timeout time,The unit is millisecond.

Returns

- true : succeed,transmit data completely
- false : fail

`int32_t esp_at_port_get_data_length (void)`

get the length of the data received,

Returns

- ≥ 0 : the length of the data received
- others : fail

`bool esp_at_base_cmd_regist (void)`

regist at base command set. If not,you can not use AT base command

`bool esp_at_user_cmd_regist (void)`

regist at user command set. If not,you can not use AT user command

`bool esp_at_wifi_cmd_regist (void)`

regist at wifi command set. If not,you can not use AT wifi command

`bool esp_at_net_cmd_regist (void)`

regist at net command set. If not,you can not use AT net command

`bool esp_at_mdns_cmd_regist (void)`

regist at mdns command set. If not,you can not use AT mdns command

`bool esp_at_driver_cmd_regist (void)`

regist at driver command set. If not,you can not use AT driver command

bool **esp_at_wps_cmd_regist** (void)

regist at wps command set. If not,you can not use AT wps command

bool **esp_at_smartconfig_cmd_regist** (void)

regist at smartconfig command set. If not,you can not use AT smartconfig command

bool **esp_at_ping_cmd_regist** (void)

regist at ping command set. If not,you can not use AT ping command

bool **esp_at_http_cmd_regist** (void)

regist at http command set. If not,you can not use AT http command

bool **esp_at_mqtt_cmd_regist** (void)

regist at mqtt command set. If not,you can not use AT mqtt command

bool **esp_at_ble_cmd_regist** (void)

regist at ble command set. If not,you can not use AT ble command

bool **esp_at_ble_hid_cmd_regist** (void)

regist at ble hid command set. If not,you can not use AT ble hid command

bool **esp_at_blufi_cmd_regist** (void)

regist at blufi command set. If not,you can not use AT blufi command

bool **esp_at_bt_cmd_regist** (void)

regist at bt command set. If not,you can not use AT bt command

bool **esp_at_bt_spp_cmd_regist** (void)

regist at bt spp command set. If not,you can not use AT bt spp command

bool **esp_at_bt_a2dp_cmd_regist** (void)

regist at bt a2dp command set. If not,you can not use AT bt a2dp command

bool **esp_at_fs_cmd_regist** (void)

regist at fs command set. If not,you can not use AT fs command

bool **esp_at_eap_cmd_regist** (void)

regist at WPA2 Enterprise AP command set. If not,you can not use AT EAP command

bool **esp_at_eth_cmd_regist** (void)

regist at ethernet command set. If not,you can not use AT ethernet command

bool **esp_at_custom_cmd_line_terminator_set** (uint8_t *terminator)

Set AT command terminator, by default, the terminator is “\r\n” You can change it by calling this function, but it just supports one character now.

Parameters terminator –the line terminator

Returns

- true : succeed,transmit data completely
- false : fail

uint8_t ***esp_at_custom_cmd_line_terminator_get** (void)

Get AT command line terminator,by default, the return string is “\r\n” .

Returns the command line terminator

const esp_partition_t ***esp_at_custom_partition_find** (esp_partition_type_t type,
esp_partition_subtype_t subtype, const char
*label)

Find the partition which is defined in at_customize.csv.

Parameters

- **type** –the type of the partition

- **subtype** –the subtype of the partition
- **label** –Partition label

Returns pointer to `esp_partition_t` structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application

void **esp_at_port_enter_specific** (*esp_at_port_specific_callback_t* callback)

Set AT core as specific status, it will call callback if receiving data. for example:

```
static void wait_data_callback (void)
{
    xSemaphoreGive(sync_sema);
}

void process_task(void* para)
{
    vSemaphoreCreateBinary(sync_sema);
    xSemaphoreTake(sync_sema, portMAX_DELAY);
    esp_at_port_write_data((uint8_t *) ">", strlen(">"));
    esp_at_port_enter_specific(wait_data_callback);
    while(xSemaphoreTake(sync_sema, portMAX_DELAY)) {
        len = esp_at_port_read_data(data, data_len);
        // TODO:
    }
}
```

Parameters **callback** –which will be called when received data from AT port

void **esp_at_port_exit_specific** (void)

Exit AT core as specific status.

const uint8_t ***esp_at_get_current_cmd_name** (void)

Get current AT command name.

void **at_handle_result_code** (*esp_at_result_code_string_index* code, void *pbuf)

5.14.3 Structures

struct **esp_at_cmd_struct**

esp_at_cmd_struct used for define at command

Public Members

char ***at_cmdName**

at command name

uint8_t (***at_testCmd**)(uint8_t *cmd_name)

Test Command function pointer

uint8_t (***at_queryCmd**)(uint8_t *cmd_name)

Query Command function pointer

uint8_t (***at_setupCmd**)(uint8_t para_num)

Setup Command function pointer

uint8_t (***at_exeCmd**)(uint8_t *cmd_name)

Execute Command function pointer

struct **esp_at_device_ops_struct**

esp_at_device_ops_struct device operate functions struct for AT

Public Members

int32_t (***read_data**)(uint8_t *data, int32_t len)

read data from device

int32_t (***write_data**)(uint8_t *data, int32_t len)

write data into device

int32_t (***get_data_length**)(void)

get the length of data received

bool (***wait_write_complete**)(int32_t timeout_msec)

wait write finish

struct **esp_at_custom_net_ops_struct**

esp_at_custom_net_ops_struct custom socket callback for AT

Public Members

int32_t (***recv_data**)(uint8_t *data, int32_t len)

callback when socket received data

void (***connect_cb**)(void)

callback when socket connection is built

void (***disconnect_cb**)(void)

callback when socket connection is disconnected

struct **esp_at_custom_ble_ops_struct**

esp_at_custom_ble_ops_struct custom ble callback for AT

Public Members

int32_t (***recv_data**)(uint8_t *data, int32_t len)

callback when ble received data

void (***connect_cb**)(void)

callback when ble connection is built

`void (*disconnect_cb)(void)`
callback when ble connection is disconnected

`struct esp_at_custom_ops_struct`
`esp_at_ops_struct` some custom function interacting with AT

Public Members

`void (*status_callback)(esp_at_status_type status)`
callback when AT status changes

`void (*pre_sleep_callback)(at_sleep_mode_t mode)`
callback before enter modem sleep and light sleep

`void (*pre_deepsleep_callback)(void)`
callback before enter deep sleep

`void (*pre_restart_callback)(void)`
callback before restart

`void (*pre_active_write_data_callback)(at_write_data_fn_t)`
callback before write data

5.14.4 Macros

`at_min(x, y)`

`at_max(x, y)`

`ESP_AT_ERROR_NO` (subcategory, extension)

`ESP_AT_CMD_ERROR_OK`
No Error

`ESP_AT_CMD_ERROR_NON_FINISH`
terminator character not found (“\r\n” expected)

`ESP_AT_CMD_ERROR_NOT_FOUND_AT`
Starting “AT” not found (or at, At or aT entered)

`ESP_AT_CMD_ERROR_PARA_LENGTH` (which_para)
parameter length mismatch

`ESP_AT_CMD_ERROR_PARA_TYPE` (which_para)
parameter type mismatch

`ESP_AT_CMD_ERROR_PARA_NUM` (need, given)
parameter number mismatch

`ESP_AT_CMD_ERROR_PARA_INVALID` (which_para)
the parameter is invalid

ESP_AT_CMD_ERROR_PARA_PARSE_FAIL (which_para)
parse parameter fail

ESP_AT_CMD_ERROR_CMD_UNSupport
the command is not supported

ESP_AT_CMD_ERROR_CMD_EXEC_FAIL (result)
the command execution failed

ESP_AT_CMD_ERROR_CMD_PROCESSING
processing of previous command is in progress

ESP_AT_CMD_ERROR_CMD_OP_ERROR
the command operation type is error

5.14.5 Type Definitions

typedef int32_t (***at_write_data_fn_t**)(uint8_t *data, int32_t len)

typedef void (***esp_at_port_specific_callback_t**)(void)
AT specific callback type.

5.14.6 Enumerations

enum **esp_at_status_type**
esp_at_status some custom function interacting with AT
Values:

enumerator **ESP_AT_STATUS_NORMAL**
Normal mode. Now mcu can send AT command

enumerator **ESP_AT_STATUS_TRANSMIT**
Transparent Transmission mode

enum **at_sleep_mode_t**
Values:

enumerator **AT_DISABLE_SLEEP**

enumerator **AT_MIN_MODEM_SLEEP**

enumerator **AT_LIGHT_SLEEP**

enumerator **AT_MAX_MODEM_SLEEP**

enumerator **AT_SLEEP_MAX**

enum **esp_at_module**

module number, Now just AT module

Values:

enumerator **ESP_AT_MODULE_NUM**

AT module

enum **esp_at_error_code**

subcategory number

Values:

enumerator **ESP_AT_SUB_OK**

OK

enumerator **ESP_AT_SUB_COMMON_ERROR**

reserved

enumerator **ESP_AT_SUB_NO_TERMINATOR**

terminator character not found (“\r\n” expected)

enumerator **ESP_AT_SUB_NO_AT**

Starting “AT” not found (or at, At or aT entered)

enumerator **ESP_AT_SUB_PARA_LENGTH_MISMATCH**

parameter length mismatch

enumerator **ESP_AT_SUB_PARA_TYPE_MISMATCH**

parameter type mismatch

enumerator **ESP_AT_SUB_PARA_NUM_MISMATCH**

parameter number mismatch

enumerator **ESP_AT_SUB_PARA_INVALID**

the parameter is invalid

enumerator **ESP_AT_SUB_PARA_PARSE_FAIL**

parse parameter fail

enumerator **ESP_AT_SUB_UNSUPPORT_CMD**

the command is not supported

enumerator **ESP_AT_SUB_CMD_EXEC_FAIL**

the command execution failed

enumerator **ESP_AT_SUB_CMD_PROCESSING**

processing of previous command is in progress

enumerator **ESP_AT_SUB_CMD_OP_ERROR**

the command operation type is error

enum **esp_at_para_parse_result_type**

the result of AT parse

Values:

enumerator **ESP_AT_PARA_PARSE_RESULT_FAIL**

parse fail, Maybe the type of parameter is mismatched, or out of range

enumerator **ESP_AT_PARA_PARSE_RESULT_OK**

Successful

enumerator **ESP_AT_PARA_PARSE_RESULT_OMITTED**

the parameter is OMITTED.

enum **esp_at_result_code_string_index**

the result code of AT command processing

Values:

enumerator **ESP_AT_RESULT_CODE_OK**

“OK”

enumerator **ESP_AT_RESULT_CODE_ERROR**

“ERROR”

enumerator **ESP_AT_RESULT_CODE_FAIL**

“ERROR”

enumerator **ESP_AT_RESULT_CODE_SEND_OK**

“SEND OK”

enumerator **ESP_AT_RESULT_CODE_SEND_FAIL**

“SEND FAIL”

enumerator **ESP_AT_RESULT_CODE_IGNORE**

response nothing, just change internal status

enumerator **ESP_AT_RESULT_CODE_PROCESS_DONE**

response nothing, just change internal status

enumerator **ESP_AT_RESULT_CODE_OK_AND_INPUT_PROMPT**

enumerator **ESP_AT_RESULT_CODE_MAX**

5.14.7 Header File

- [components/at/include/esp_at.h](#)

5.14.8 Functions

const char ***esp_at_get_current_module_name** (void)

get current module name

const char ***esp_at_get_module_name_by_id** (uint32_t id)

get module name by index

uint32_t **esp_at_get_module_id** (void)

get current module id

void **esp_at_board_init** (void)

init peripheral and default parameters in factory_param.bin

bool **esp_at_web_server_cmd_regist** (void)

regist WiFi config via web command. If not, you can not use web server to config wifi connect

void **esp_at_main_preprocess** (void)

some workarounds for esp-at project

5.14.9 Macros

ESP_AT_PORT_TX_WAIT_MS_MAX

ESP_AT_FACTORY_PARAMETER_SIZE

Chapter 6

6.1 AT Firmware

6.1.1 There is no released firmware for my module. Where can I get the firmware for it?

If there is no released firmware for your module in the [AT Binary Lists](#) chapter, please consider the following options:

- Use the firmware for the module that has the same hardware configuration as yours (see [ESP-AT Firmware Differences](#) for which module has the same configuration).
- [Create a factory parameter bin](#) and [compile the firmware](#) for your module by yourself.

6.1.2 How to get the source code of AT firmware?

ESP-AT firmware is partially open-source. See [esp-at](#) for the open-source repository.

6.1.3 How to download the AT firmware on Espressif's official website?

- Download the flash tool: [Flash Download Tools](#).
- See [AT Downloading Guide](#) for the download address.

6.1.4 How to combine all the bin files compiled by ESP-AT?

You can use the **combine** button of the [Flash Download Tools](#).

6.1.5 Does the AT firmware shipped in modules support flow control?

- Hardware flow control is supported, but software flow control is not.
- To enable or disable hardware flow control, run [AT+UART_CUR](#) or [AT+UART_DEF](#).
- See [Hardware connection](#) for more details.

6.2 AT Commands and Responses

6.2.1 What is the reason why AT prompts busy?

- The “busy” prompt indicates that the previous command is being executed, and the system cannot respond to the current input. The processing mechanism of the AT commands is serial, i.e. one command at a time.
- Any input through serial ports is considered to be a command input, so the system will also prompt “busy” or “ERROR” when there is any extra invisible character input.
 - Serial input AT+GMR (change character CR LF) (space character), because AT+GMR (change character CR LF) is already a complete AT command, the system will execute the command. At this time, if the system has not completed the AT+GMR operation, it has received the following space character, which will be regarded as a new command input, and the system will prompt “busy”. But if the system has completed the AT+GMR operation, and then receives the following space character, the space character will be regarded as an error command, and the system will prompt “ERROR”.
 - After the MCU sends AT+CIPSEND and receives the busy p.. response, the MCU needs to resend the data. Because busy p.. represents the previous command is being executed, the current input is invalid. It is recommended to wait for the response of the last AT command before the MCU sends a new command again.

6.2.2 Why does the ESP-AT firmware always return the following message after the I powered up the device and sent the first command?

```
ERR CODE:0x010b0000  
busy p...
```

- This message means that the previous command is being executed.
- Normally only “busy p...” is displayed. The ERR CODE is displayed because the error code prompt is enabled.
- If you receive this message after sending the first command on power-up, the possible reasons are: the command is followed by the unnecessary newline/space/other symbols; or two or more AT commands are sent in succession.

6.2.3 What commands are supported by the default ESP-AT firmware on different modules, and from which version are they supported?

- To learn what commands are supported by the default ESP-AT firmware on different modules, please refer to [ESP-AT Firmware Differences](#).
- To learn from which version a command is supported and what issues are fixed in each version, please refer to [release notes](#).

6.2.4 When the host MCU sends an AT command to the ESP32-C2 device, there is no response. What is the reason?

A terminator (“ATrn”) must be added after an AT command when the host MCU sending AT commands to an ESP32-C2 device. Please see [Check Whether AT Works](#).

6.2.5 Do AT commands support ESP-WIFI-MESH?

Currently, AT commands do not support ESP-WIFI-MESH.

6.2.6 Does AT support websocket commands?

- Not supported in the default firmware.
- It can be implemented by custom commands. See [websocket](#) and [How to add user-defined AT commands](#) for more information.

6.2.7 Can AT command set Bluetooth LE transmit power?

Yes, the [AT+RFPOWER](#) command can set Bluetooth LE transmit power. ESP32-C2 Wi-Fi and Bluetooth LE share the same antenna.

6.2.8 How to support commands that are not supported by the default firmware but can be supported after configuring and compiling the ESP-AT project?

For example, if you need to support the WPA2 Enterprise function on the ESP32-C2 series, configure and compile the firmware by yourself. Open the WPA2 Enterprise function in menuconfig when compiling: `./build.py menuconfig>Component config>AT>[*]AT WPA2 Enterprise command support.`

6.2.9 How to handle special characters in AT commands?

Please refer to the escape character syntax described in the [AT Command Types](#) section.

6.2.10 Can the serial port baudrate be modified in AT Commands? (Default: 115200)

Yes, you can use either of the two ways below to modify it:

- Use the command [AT+UART_CUR](#) or [AT+UART_DEF](#).
- Re-compile the AT firmware: [establish the compiling environment](#) and [change the UART baudrate](#).

6.2.11 After ESP32-C2 enters the passthrough mode using AT commands, can ESP32-C2 give a message if the connected hotspot is disconnected?

- Yes, you can configure it with [AT+SYSMSG](#), i.e., set AT+SYSMSG=4. In this way, the serial port will report “WIFI DISCONNECTrn” when the connected hotspot is disconnected.
- Note that this command is added after AT v2.1.0. It is not available for v2.1.0 and earlier versions.

6.3 Hardware

6.3.1 How big is the chip flash required for ESP-AT firmware on different modules?

- For ESP32-C2 series modules, please refer to [ESP-AT Firmware Differences](#).

6.3.2 How to view the error log of AT firmware?

- For ESP32-C2, the error log is output through the download port. By default, UART0 is GPIO21 and GPIO20.
- See [Hardware Connection](#) for more details.

6.3.3 The UART1 communication pin used by ESP-AT on the ESP32-C2 module is inconsistent with the default UART1 pin described in the ESP32-C2 module's datasheet?

- ESP32-C2 supports IO matrix. When compiling ESP-AT, you can configure UART1 pins in menuconfig, so they may be inconsistent with the pins described in the module datasheet.
- See [factory_param_data.csv](#) for more details.

6.4 Performance

6.4.1 How long does it take for the AT to connect to Wi-Fi?

- In an office scenario, the connection time is 5 seconds. However, in actual practice, Wi-Fi connection time depends on the router performance, network environment, module antenna performance, etc.
- The maximum timeout time can be set by the `<jap_timeout>` parameter of [AT+CWJAP](#).

6.4.2 Is it possible to change the TCP send window size in AT firmware?

- Currently, it cannot be changed by AT commands, but you can configure and compile the ESP-AT project to generate a new firmware.
- You can configure the menuconfig parameter: `Component config > LWIP > TCP > Default send buffer size`.

6.4.3 How to test and optimize the throughput of ESP32-C2 AT?

- Many factors are affecting the AT throughput test. It is recommended to use the iperf example in esp-idf for testing. While testing, please use the passthrough mode, adjust the data length to 1460 bytes, and send data continuously.
- If the test rate does not meet your requirements, please refer to [How to Improve ESP-AT Throughput Performance](#).

6.5 Other

6.5.1 What interfaces of ESP32-C2 chips can be used to transmit AT commands?

- ESP32-C2 can transmit AT commands through UART.
- The default firmware uses UART for transmission. If you need SDIO or SPI interface to transmit AT commands, you can configure it through `./build.py menuconfig -> Component config -> AT` when compiling the ESP-AT project by yourself.
- See [AT through SDIO](#) , [AT through SPI](#) , or [AT through socket](#) for more details.

6.5.2 How does ESP-AT conduct BQB certification?

Please contact [Espressif](#) for solutions.

6.5.3 How do I specify the TLS protocol version for ESP32-C2 AT?

When compiling the esp-at project, you can disable the unwanted versions in the `./build.py menuconfig -> Component config -> mbedTLS`.

6.5.4 How to modify the number of TCP connections in AT?

- At present, the maximum number of TCP connections of the AT default firmware is 5.
- The ESP32-C2 AT supports a maximum of 16 TCP connections, which can be configured in menuconfig as follows:
 - `./build.py menuconfig -> Component config -> AT -> (16)AT socket maximum connection number`
 - `./build.py menuconfig -> LWIP -> (16)Max number of open sockets`

Chapter 7

Index of Abbreviations

A2DP Advanced Audio Distribution Profile

高级音频分发框架

ADC Analog-to-Digital Converter

模拟数字转换器

ALPN Application Layer Protocol Negotiation

应用层协议协商

AT AT stands for “attention” .

AT 是 attention 的缩写。

AT command port The port that is used to send AT commands and receive responses. More details are in the [AT port](#) introduction.

AT 命令端口 也称为 AT 命令口，用于发送 AT 命令和接收响应的端口。更多介绍请参考[AT 端口](#)。

AT log port The port that is used to output log. More details are in the [AT port](#) introduction.

AT 日志端口 也称为 AT 日志口，用于输出 AT 日志的端口。更多介绍请参考[AT 端口](#)。

AT port AT port is the general name of AT log port (that is used to output log) and AT command port (that is used to send AT commands and receive responses). Please refer to [Hardware Connection](#) for default AT port pins and [How to Set AT Port Pins](#) for how to customize them.

AT 端口 AT 端口是 AT 日志端口（用于输出日志）和 AT 命令端口（用于发送 AT 命令和接收响应）的总称。请参考[Hardware Connection](#) 了解默认的 AT 端口管脚，参考[How to Set AT Port Pins](#) 了解如何自定义 AT 端口管脚。

Bluetooth LE Bluetooth Low Energy

低功耗蓝牙

BluFi Wi-Fi network configuration function via Bluetooth channel

BluFi 是一款基于蓝牙通道的 Wi-Fi 网络配置功能

Command Mode Default operating mode of AT. In the command mode, any character received by the AT command port will be treated as an AT command, and AT returns the command execution result to the AT command port. AT enters [Data Mode](#) from [Command Mode](#) in the following cases.

- After sending the [AT+CIPSEND](#) set command successfully and returns >.
- After sending the [AT+CIPSEND](#) execute command successfully and returns >.
- After sending the [AT+CIPSENDL](#) set command successfully and returns >.
- After sending the [AT+CIPSENDEX](#) set command successfully and returns >.
- After sending the [AT+SAVETRANSLINK](#) set command successfully and sending the [AT+RST](#) command and restart the module.

In the data mode, send the [+++](#) command, AT will exit from [Data Mode](#) and enter the [Command Mode](#).

命令模式 AT 的默认工作模式。在命令模式下，AT 命令端口收到的任何字符都会被当作 AT 命令进行处理，同时 AT 会在命令端口回复命令执行结果。AT 在下列情况下，会从[命令模式](#)进入[数据模式](#)。

- 发送[AT+CIPSEND](#) 设置命令成功，回复 > 之后
- 发送[AT+CIPSEND](#) 执行命令成功，回复 > 之后
- 发送[AT+CIPSENDL](#) 设置命令成功，回复 > 之后
- 发送[AT+CIPSENDEX](#) 设置命令成功，回复 > 之后
- 发送[AT+SAVETRANSLINK](#) 设置命令成功，再发送 ([AT+RST](#)) 命令，模组重启之后

在数据模式下，发送+++ 命令，会从数据模式退出，进入命令模式。

Data Mode In the data mode, any character received by the AT command port will be treated as data (except for special +++) instead of the AT command, and these data will be sent to the opposite end without modification. AT enters *Data Mode* from *Command Mode* in the following cases.

- After sending the *AT+CIPSEND* set command successfully and returns >.
- After sending the *AT+CIPSEND* execute command successfully and returns >.
- After sending the *AT+CIPSENDL* set command successfully and returns >.
- After sending the *AT+CIPSENDEX* set command successfully and returns >.
- After sending the *AT+SAVETRANSLINK* set command successfully and sending the *AT+RST* command and restart the module.

In the data mode, send the +++ command, AT will exit from *Data Mode* and enter the *Command Mode*.

数据模式 在数据模式下，AT 命令端口收到的任何字符都会被当作数据（除了特殊的+++），而不是 AT 命令，这些数据会无修改的发往对端。AT 在下列情况下，会从命令模式进入数据模式。

- 发送*AT+CIPSEND* 设置命令成功，回复 > 之后
- 发送*AT+CIPSEND* 执行命令成功，回复 > 之后
- 发送*AT+CIPSENDL* 设置命令成功，回复 > 之后
- 发送*AT+CIPSENDEX* 设置命令成功，回复 > 之后
- 发送*AT+SAVETRANSLINK* 设置命令成功，再发送*AT+RST* 命令，模组重启之后

在数据模式下，发送+++ 命令，会从数据模式退出，进入命令模式。

DHCP Dynamic Host Configuration Protocol

MSB Most Significant Bit

最高有效位

MTU maximum transmission unit

最大传输单元

NVS Non-Volatile Storage

非易失性存储器

Normal Transmission Mode Default Transmission Mode

In normal transmission mode, users can send AT commands. For examples, users can send MCU data received by AT command port to the opposite end of transmission by *AT+CIPSEND*; and the data received from the opposite end of transmission will also be returned to MCU through AT command port with additional prompt: *+IPD*.

During a normal transmission, if the connection breaks, ESP32-C2 will give a prompt and will not attempt to reconnect.

More details are in [Transmission Mode Shift Diagram](#).

普通传输模式 默认传输模式

在普通传输模式下，用户可以发送 AT 命令。例如，用户可以通过 [AT+CIPSEND](#) 命令，发送 AT 命令口收到的 MCU 数据到传输对端。从传输对端收到的数据，会通过 AT 命令口返回给 MCU，同时会附带 +IPD 信息。

普通传输模式时，如果连接断开，ESP32-C2 不会重连，并提示连接断开。

更多介绍请参考[Transmission Mode Shift Diagram](#)。

OWE Opportunistic Wireless Encryption. OWE is a Wi-Fi standard which ensures that the communication between each pair of endpoints is protected from other endpoints.

More details are in [Wikipedia](#).

机会性无线加密。OWE 是一种 Wi-Fi 标准，它确保每对端点之间的通信受到保护，不受其他端点的影响。

更多介绍请参考 [维基百科](#)。

Passthrough Mode Also called as “Passthrough Sending & Receiving Mode” .

In passthrough mode, users cannot send AT commands except special +++ command. All MCU data received by AT command port will be sent to the opposite end of transmission without any modification; and the data received from the opposite end of transmission will also be returned to MCU through AT command port without any modification.

During the Wi-Fi passthrough transmission, if the connection breaks, ESP32-C2 (as client) will keep trying to reconnect until +++ is input to exit the passthrough transmission; ESP32-C2 (as server) will shutdown the old connection and listen new connection until +++ is input to exit the passthrough transmission.

More details are in [Transmission Mode Shift Diagram](#).

透传模式 也称为“透传发送接收模式”。

在透传模式下，用户不能发送其它 AT 命令，除了特别的+++ 命令。AT 命令口收到的所有的 MCU 数据都将无修改地，发送到传输对端。从传输对端收到的数据也会通过 AT 命令口无修改地，返回给 MCU。

Wi-Fi 透传模式传输时，如果连接断开，ESP32-C2 作为客户端时，会不停地尝试重连，此时单独输入+++ 退出透传，则停止重连；ESP32-C2 作为服务器时，会关闭连接同时监听新的连接，此时单独输入+++ 退出透传。

更多介绍请参考[Transmission Mode Shift Diagram](#)。

Transmission Mode Shift Diagram

Fig. 1: Transmission Mode Shift Diagram

More details are in the following introduction.

- [Normal Transmission Mode](#) (普通传输模式)
- [Passthrough Receiving Mode](#) (透传接收模式)
- [Passthrough Mode](#) (透传模式)
- [AT+CIPMODE](#)
- [AT+CIPSEND](#)
- [+++](#)
- [AT+SAVETRANSLINK](#)

Passthrough Receiving Mode The temporary mode between [Normal Transmission Mode](#) and [Passthrough Mode](#).

In passthrough receiving mode, AT cannot send any data to the opposite end of transmission; but the data received from the opposite end of transmission can be returned to MCU through AT command port without any modification. More details are in [Transmission Mode Shift Diagram](#).

透传接收模式 在普通传输模式和透传模式之间的一个临时模式。

在透传接收模式，AT 不能发送数据到传输对端；但 AT 可以收到来自传输对端的数据，通过 AT 命令口无修改地返回给 MCU。更多介绍请参考[Transmission Mode Shift Diagram](#)。

PBC Push Button Configuration

按钮配置

PCI Authentication Payment Card Industry Authentication. In ESP-AT project, it refers to all Wi-Fi authentication modes except OPEN and WEP.

PCI 认证，在 ESP-AT 工程中指的是除 OPEN 和 WEP 以外的 Wi-Fi 认证模式。

PKI A public key infrastructure (PKI) is a set of roles, policies, hardware, software and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

More details are in [Public Key Infrastructure](#).

公开密钥基础建设。公开密钥基础建设（PKI）是一组由硬件、软件、参与者、管理政策与流程组成的基础架构，其目的在于创造、管理、分配、使用、存储以及撤销数字证书。

更多介绍请参考 [公开密钥基础建设](#)。

Wi-Fi 保护访问

WPA2 Wi-Fi Protected Access II

Wi-Fi 保护访问 II

WPS Wi-Fi Protected Setup

Wi-Fi 保护设置

Chapter 8

About

This is documentation of [ESP-AT](#), a solution developed by Espressif to quickly and easily interface with ESP32-C2 products.

Espressif Wi-Fi and Bluetooth chipsets are often used as add-on modules to seamlessly integrate wireless connectivity features into new and existing products. In an effort to facilitate this and cut down on engineering costs, Espressif Systems has developed [AT firmware](#) as well as a rich set of [AT commands](#) that can be used to interface with Espressif products.

Fig. 1: ESP-AT Solution

The AT firmware allows for rapid integration by providing:

- In-built TCP/IP stack and data buffering
- Easy integration with resource-constrained host platforms
- Easy-to-parse command-response protocols
- Customized, user-defined AT commands
- genindex

Fig. 2: ESP-AT Commands
